Associate Professor
Georgetown University

November 11, 2025

Figure 1: US nighttime lights data, 1994 (DMSP, composite from 29 orbits)

Figure 2: US nighttime lights data, 1995 (DMSP, composite from 236 orbits)

Overview

Nearly all production and consumption after sundown requires (and emits) light

1. Household appliances
2. Office equipment
3. Transportation
4. Sporting events
5. Street markets
6. Restaurants
7. Factory operations
8. Roadworks
9. Construction
10. Studying and homework

Figure 3: Emitting light

Remote sensing of nighttime lights allows us to observe human activity from space

Applications of Luminosity Data

Economic activity, income, growth

1. Persistent economic data challenges
 - a) in most countries, GDP stats not available at the sub-national level
 - b) national accounts & surveys are sometimes unreliable
 - c) some locations too costly, dangerous for field & survey work
2. Luminosity has some advantages
 - a) more spatially fine-grained than standard income accounts
 - b) regular, frequent time intervals
 - c) recorded homogeneously across national borders
 - d) available in hard-to-reach areas
3. Not a bad proxy measure
 - a) nighttime lights found to be positively correlated with GDP, GRP at multiple spatial scales

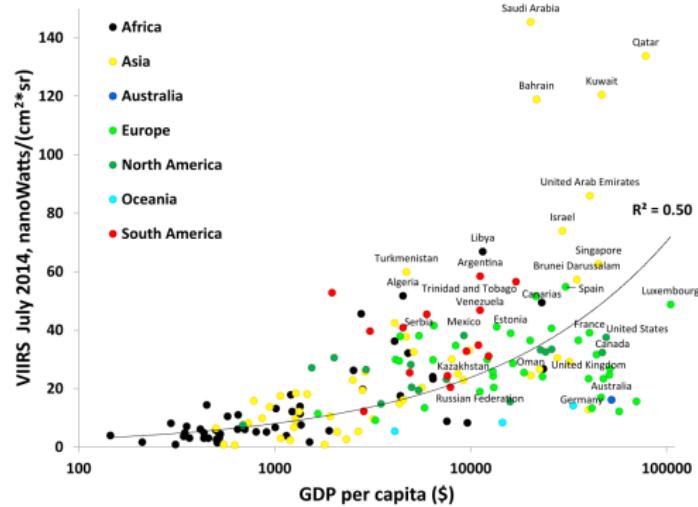

Figure 4: Luminosity and GDP/capita

Urbanization

1. First applications of luminosity data:
 - a) delineate urban extents
 - b) track electrification, street lighting
2. Luminosity captures things surveys, census can't
 - a) growth of informal, illegal settlements
 - b) communities with inadequate infrastructure
 - c) emergence of new local urban centers
 - d) characterize urban growth over time

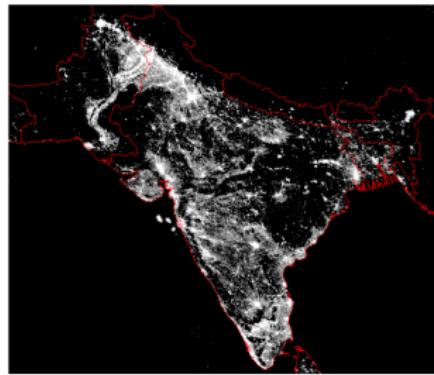

Figure 5: South Asia, 1994

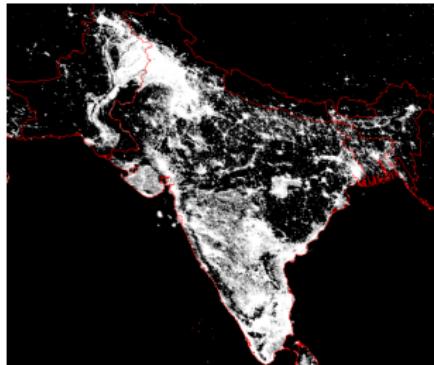

Figure 6: South Asia, 2010

Emergency management, recovery

1. Luminosity captures impact of emergencies
 - a) disasters cause damage to power lines, disrupt electric utility services
 - b) luminosity data can detect power outages, also fires, flares, other sudden increases in light
2. But not everything is visible from space
 - a) cloud cover prevents real-time storm damage tracking and assessment
 - b) luminosity better suited for monitoring non-meteorological events (e.g. earthquakes, accidents), long-term tracking of recovery efforts

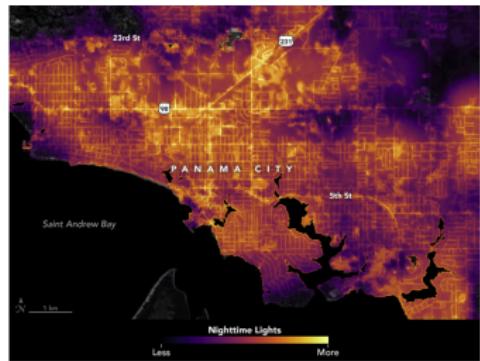

Figure 7: Before landfall

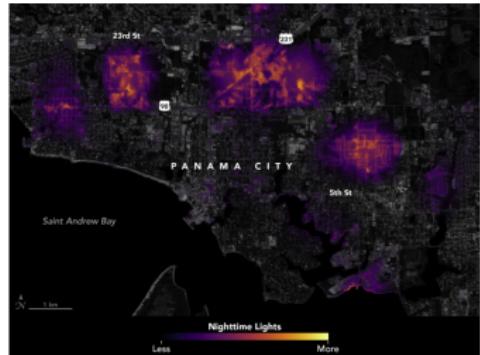

Figure 8: After landfall

Armed conflict

1. War creates darkness
 - a) direct: power grid damage
 - b) indirect: population displacement, curfews, intentional dimming to avoid detection
2. Danger lurks in darkness
 - a) power disruptions constrain economic development, harm public health
 - b) fall in light emissions is warning that civilians, hospitals lack stable electricity supply
3. Data can illuminate the physical impact of war
 - a) luminosity data allow us to track impact of war on public services, utilities, urban economic activity
 - b) this analysis can be near-real time

Figure 9: October 2021

Figure 10: October 2022

Technological change

1. Outdoor lighting technology evolves
 - a) wood, dung → oil
 - b) oil → gas
 - c) gas → incandescent
 - d) incandescent → LED, HID
2. Ecological and social impacts
 - a) each change increases emissions, changes spectrum of visible light
 - b) spectral change affects perception of artificial lights by animals
 - c) LEDs are more easily dimmed, lighting becomes more temporally dynamic
3. This is also a measurement challenge
 - a) change in spectrum can be mistaken for change in light intensity

Figure 11: Alles ist erleuchtet

Varieties of Luminosity Data

Space-based sensors for night-lights (partial list)

Sensor	Spatial resolution	Temporal resolution	Availability	Free?	On-board calibration
DMSP/OLS	3km	Monthly	1992-2013	✓	
Landsat 8	30m	Irregular	2013-	✓	
VIIRS/DNB	740m	Daily	2012-	✓	✓
EROS-B	<1m	Daily	2013-		✓
Jilin-1	<1m	Daily	2017-		✓

Defense Meteorological Satellite Program (DMSP)

1. History

- a) 1960s: starts as DoD's meteorological program
 - goal: prevent spy satellites from wasting resources when targets are cloud-covered
- b) 1992: images available in digital form
- c) 1994: NOAA launches global nightlights program

2. Limitations

- a) data from different years not directly comparable due to different atmospheric conditions, sensor settings and degradation
- b) temporal analysis requires intercalibration
 - use invariant pixels as training data
 - calibrate raw images to same radiometric level as base image
- c) images blurred due to scattering, saturation

Figure 12: DMSP-5D2

Link: eogdata.mines.edu/products/dmsp/

Visible Infrared Imaging Radiometer Suite (VIIRS)

1. History

- a) 2011: sensor launches onboard Suomi NPP satellite
- b) quickly becomes industry standard
- c) main product: Day and Night Band (DNB)

2. Advantages over DMSP

- on-board calibration enables temporal comparisons
- higher spatial precision
- sensitive to lower light levels
- no saturation in urban areas
- cloud-free, stray light corrections
- free daily images + monthly, annual composites

Figure 13: Suomi NPP

Link: eogdata.mines.edu/products/vnl/

Not all orbits make good data

Requirements for nighttime light observation:

1. Center half of orbital swath
 - (i.e. area being imaged by satellite)
2. No sunlight
 - (no high-latitude zones in summer)
3. No moonlight
 - (within-month variation)
4. No solar glare
 - (e.g. from solar panels)
5. Cloud-free
 - (sorry, Seattle. hello, Dubai)
6. No auroral emissions
 - (why Santa has evaded detection)
7. No forest fires
 - (no intense sources of natural light)

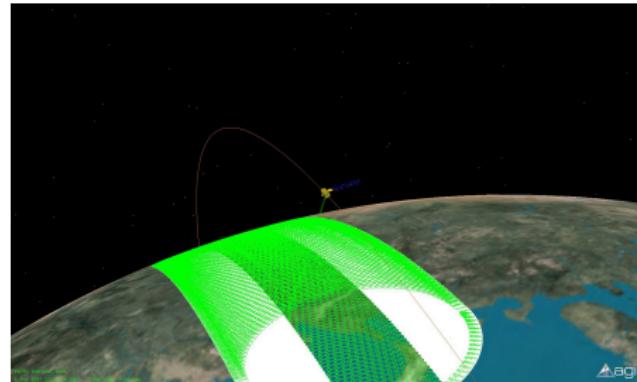

Figure 14: Swath path

Illustration of cloud cover contamination

Figure 15: Daily VIIRS data for Ukraine, 2021-2022

Vignettes

Overview of lab exercise

1. Vignettes on differences in luminosity across borders
 - a) Korean peninsula
 - b) Island of Hispaniola
2. Vignette on differences in luminosity over time
 - a) Syrian Civil War

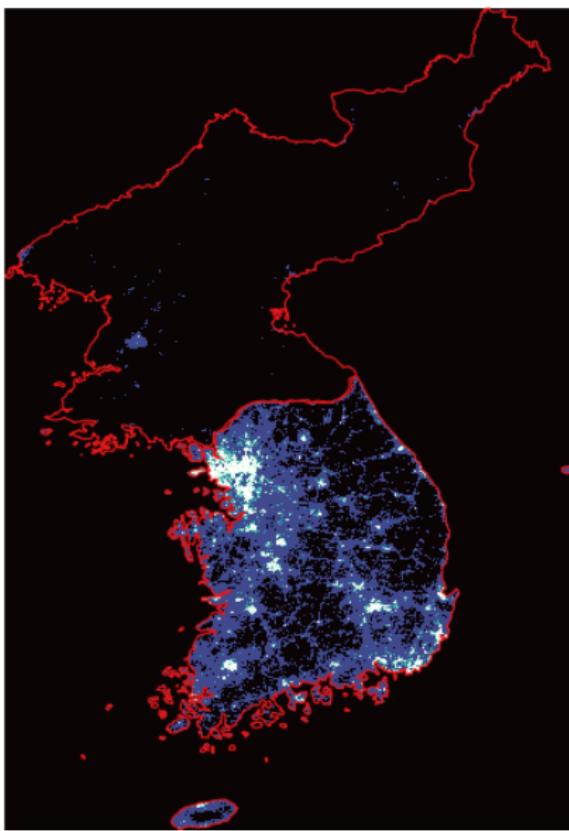

Figure 16: Vignette 1 / Korea

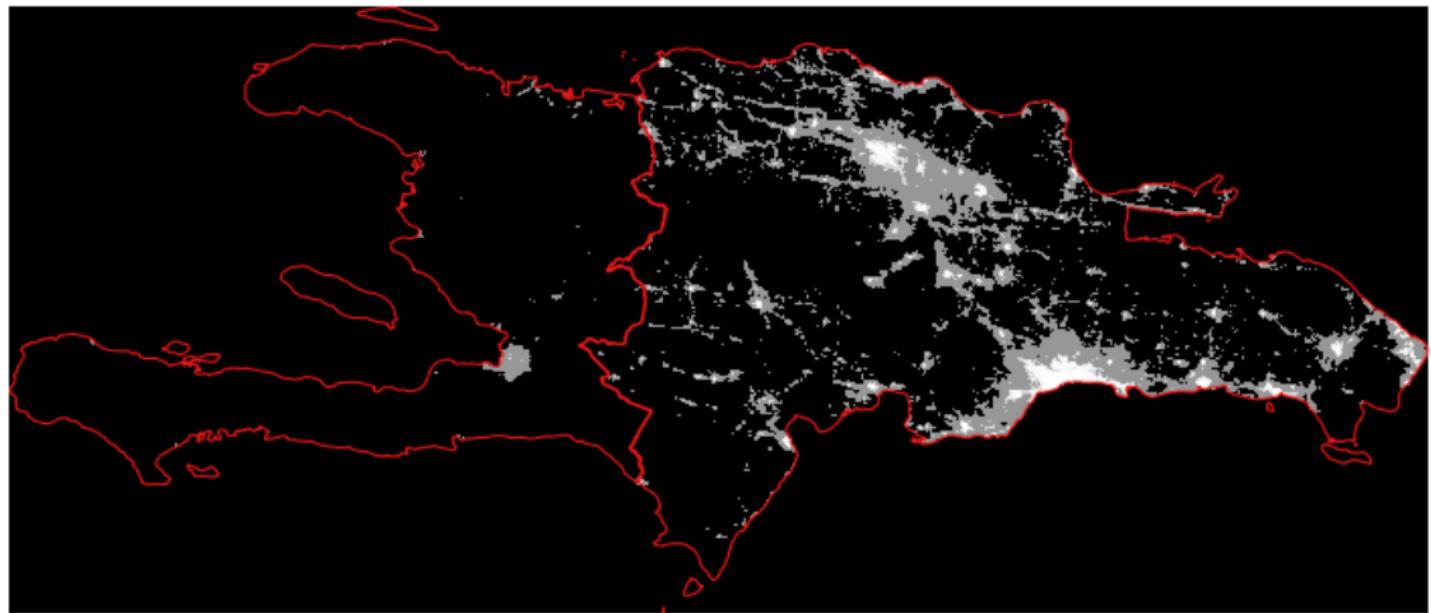

Figure 17: Vignette 2 / Hispaniola

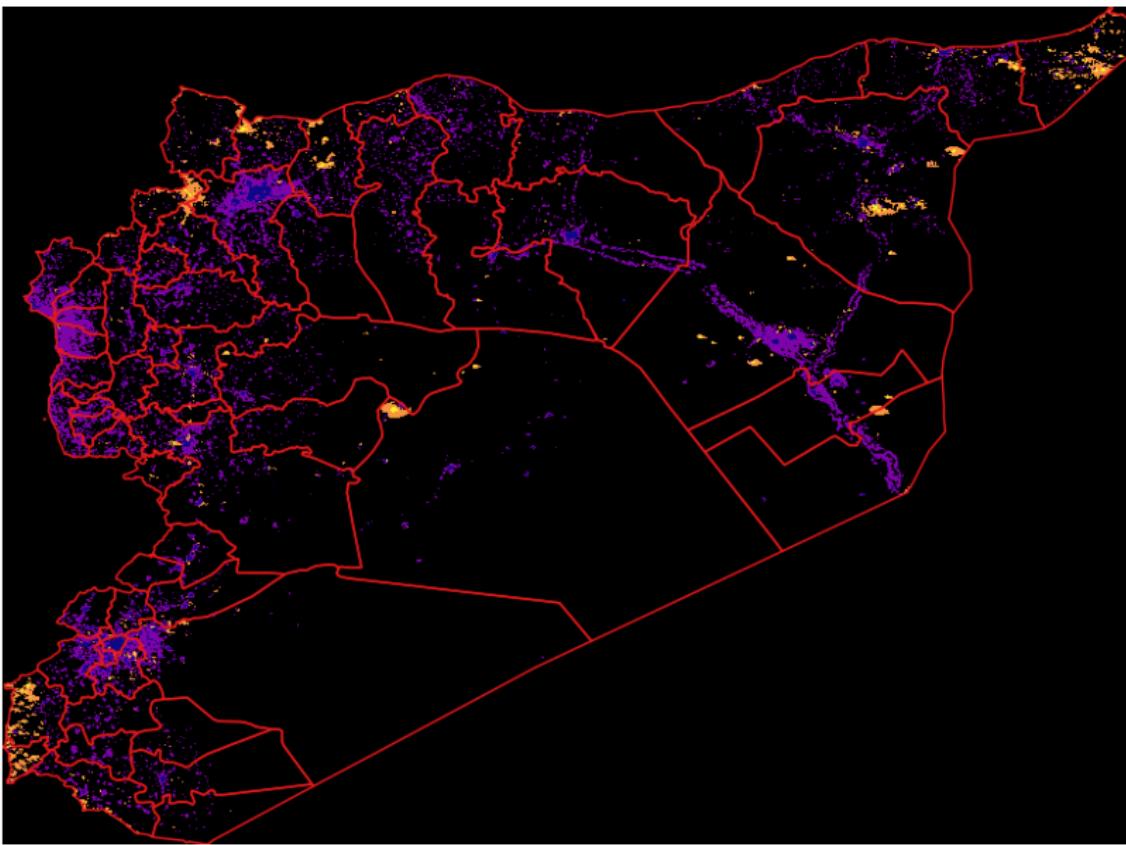

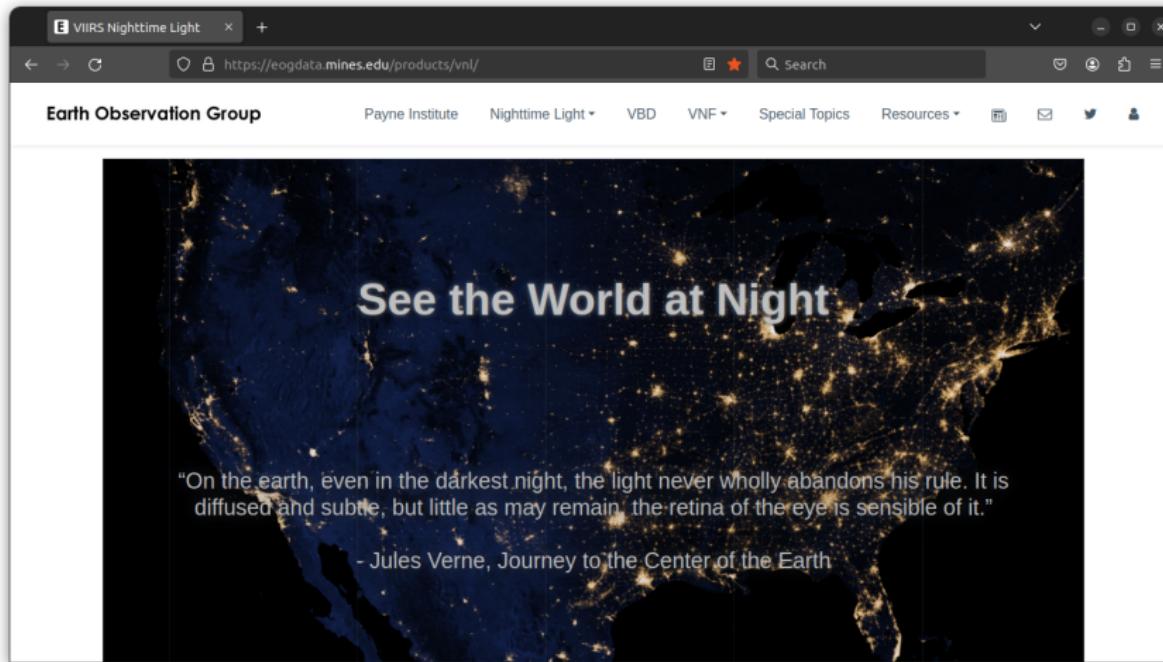

Figure 18: Vignette 3 / Syria

We can obtain **VIIRS nighttime luminosity (vnl) data** from
eogdata.mines.edu/products/vnl/

Scroll down to the “Annual VNL V2” section

The screenshot shows a web browser window with the URL https://eogdata.mines.edu/products/vnl/#annual_v2. The main content area is titled "Annual VNL V2" and discusses the production of annual global VIIRS nighttime lights from 2012 to 2020. It mentions a modification of the original method based on nightly data (Annual VNL V1). The sidebar on the right lists several resources:

- Introduction
- Monthly DNB Composite
- Annual VNL V1
- Annual VNL V2
- Nightly DNB Mosaic and Cloud
- Nightly DNB Profile and Analysis
- Country and City VNL Study
- For Artists
- Lumen Watch

Click on the “Go to Download V2.2” button for the most recent year’s data

The screenshot shows a web browser window for the Earth Observation Group's VIIRS Nighttime Light products. The main content area displays two satellite maps of Earth's nighttime lights. The top map is labeled "2016" and the bottom map is labeled "2012". Both maps show bright areas representing cities and populated regions against a dark background.

Earth Observation Group

Apache by @adamwhitcroft

Let's also grab data for the "oldest" year available.
Navigate to the parent directory and find the annual data in the v21/ folder

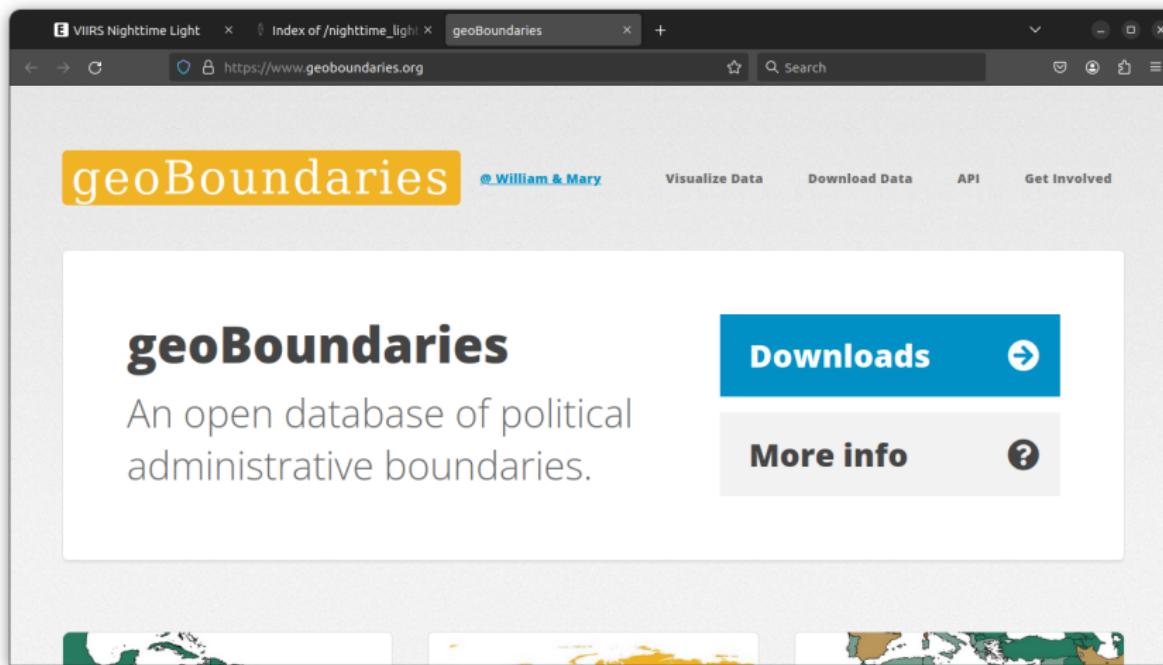

There are two files ending in `.average_masked.dat.tif.gz` here.
Download the first one (April through December)

Let's get some **country and administrative boundaries** from `geoboundaries.org`

Navigate to the “Individual Country Files” section

The screenshot shows a web browser window with three tabs at the top: "VIIRS Nighttime Light", "Index of /nighttime_light", and "geoBoundaries". The main content area displays three cards:

- Individual Country Files**: Shows a map of the Americas with green and grey shading. Description: "As they would represent themselves." Note: "Our most recent files for each individual country, standardized and ready to use."
- Global Composite Files**: Shows a world map with yellow and orange shading. Description: "Disputed areas included." Note: "Seamless global layers with demarcations for disputed areas."
- Simplified Boundaries**: Shows a map of Africa and the Middle East with green and brown shading. Description: "When you just need a visual." Note: "Simplified files with lower file sizes, for your cartographic needs."

The URL <https://www.geoboundaries.org/countryDownloads.html> is visible at the bottom of the browser window.

Download country-level (ADM0) data for South and North Korea (KOR, PRK)

The geoBoundaries open license ([CC-BY 4.0](#)) country dataset seeks to represent every nation "as they would represent themselves", with no special identification of disputed areas. If you would prefer data that explicitly includes disputed areas, please see the global composite dataset. [Attribution](#) is required for all uses of this dataset.

Individual Country Files

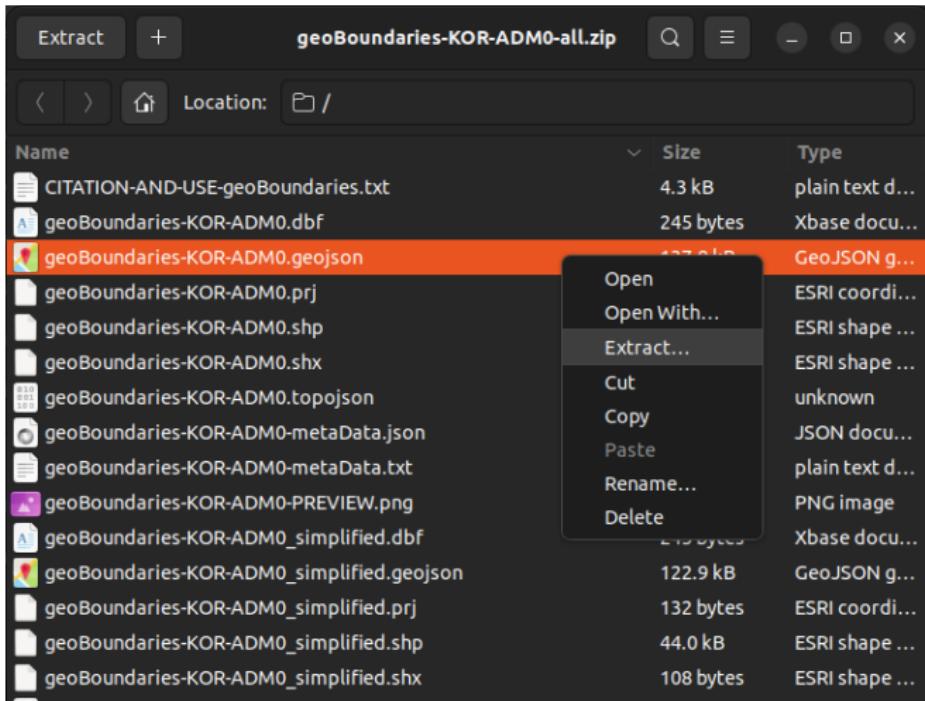

Name	ISO-3	Type	Year	Preview	Source
korea	filter color				
Republic of Korea	KOR	ADM0	2021		Natural Earth, geoBoundaries
Republic of Korea	KOR	ADM1	2021		Natural Earth
Republic of Korea	KOR	ADM2	2020		geoBoundaries, citypopulation.de
Republic of Korea	KOR	ADM3	2018		Justin Meyers, KoStat
Dem. People's Repub...	PRK	ADM0	2018		World Food Programme, OCHA RO...
Dem. People's Repub...	PRK	ADM1	2018		World Food Programme, OCHA RO...
Dem. People's Repub...	PRK	ADM2	2019		World Food Programme, OCHA RO...

Single Country Files
Files for individual countries

Global Files
A single file for the entire globe

Simplified Files

When you unzip, the only file you need to extract is one ending in ADM0.geojson

Repeat this process for country-level (ADM0) data for Haiti (HTI) . . .

The screenshot shows a web browser window with the following details:

- Title Bar:** VIIRS Nighttime Light, Index of /nighttime_light, geoBoundaries.
- Address Bar:** https://www.geoboundaries.org/countryDownloads.html
- Content Area:**
 - Section Header:** Individual Country Files
 - Text Description:** The geoBoundaries open license ([CC-BY 4.0](#)) country dataset seeks to represent every nation "as they would represent themselves", with no special identification of disputed areas. If you would prefer data that explicitly includes disputed areas, please see the global composite dataset. [Attribution](#) is required for all uses of this dataset.
 - Data Table:** A table listing country datasets for Haiti. The first row has a red border around the "Name" column, which contains "haiti".

Name	ISO-3	Type	Year	Preview	Source
haiti	filter color				
Haiti	HTI	ADM0	2017		OpenStreetMap, Wambacher
Haiti	HTI	ADM1	2017		OpenStreetMap, Wambacher
Haiti	HTI	ADM2	2017		OpenStreetMap, Wambacher
Haiti	HTI	ADM3	2018		FEWS NET
 - Download Options:** Three blue buttons for download:
 - Single Country Files** (Files for individual countries)
 - Global Files** (A single file for the entire globe)
 - Simplified Files**

and country-level (ADM0) data for Dominican Republic (DOM)...

The geoBoundaries open license ([CC-BY 4.0](#)) country dataset seeks to represent every nation "as they would represent themselves", with no special identification of disputed areas. If you would prefer data that explicitly includes disputed areas, please see the global composite dataset. [Attribution](#) is required for all uses of this dataset.

Name	ISO-3	Type	Year	Preview	Source
dominican	filter color				
Dominican Republic	DOM	ADM0	2020		Caribbean GeoPortal, N/A
Dominican Republic	DOM	ADM1	2022		Natural Earth
Dominican Republic	DOM	ADM2	2020		Caribbean GeoPortal, N/A

Single Country Files
Files for individual countries

Global Files
A single file for the entire globe

Simplified Files

and district-level (ADM2) data for Syria (SYR)

The screenshot shows a web browser window with the URL <https://www.geoboundaries.org/countryDownloads.html>. The title bar includes tabs for "VIIRS Nighttime Light", "Index of /nighttime_light", and "geoBoundaries". The main content area is titled "Individual Country Files". On the left, there is a sidebar with three buttons: "Single Country Files" (selected), "Global Files", and "Simplified Files". The main content area contains a table with the following data:

Name	ISO-3	Type	Year	Preview	Source
syria	filter color				
Syrian Arab Republic	SYR	ADM0	2017		OpenStreetMap, Wambacher
Syrian Arab Republic	SYR	ADM1	2017		United Nations Cartographic Section...
Syrian Arab Republic	SYR	ADM2	2017		United Nations Cartographic Section...
Syrian Arab Republic	SYR	ADM3	2017		United Nations Cartographic Section...

We will be using the same event **data on violence** as in the last lab:
UCDP GED version 25.1, in csv format

The screenshot shows a web browser window with three tabs open. The active tab is titled "UCDP Dataset Download" and displays the "UCDP Georeferenced Event Dataset (GED) Global version 23.1". The page content includes:

- A brief description of the dataset: "This dataset is UCDP's most disaggregated dataset, covering individual events of organized violence (phenomena of lethal violence occurring at a given time and place). These events are sufficiently fine-grained to be geo-coded down to the level of individual villages, with temporal durations disaggregated to single, individual days."
- A section titled "Available as:" with icons for CSV, EXCEL, R, STATA, and CODEBOOK.
- A "Please cite:" section with two entries:
 - Davies, Shawn, Therese Pettersson & Magnus Öberg (2023). Organized violence 1989-2022 and the return of conflicts between states?. *Journal of Peace Research* 60(4).
 - Sundberg, Ralph and Erik Melander (2013) Introducing the UCDP Georeferenced Event Dataset. *Journal of Peace Research* 50(4).
- A link to the "UCDP Candidate Events Dataset (UCDP Candidate) version 24.0.X" with the URL <https://ucdp.uu.se/downloads/ged/ged231-csv.zip>.

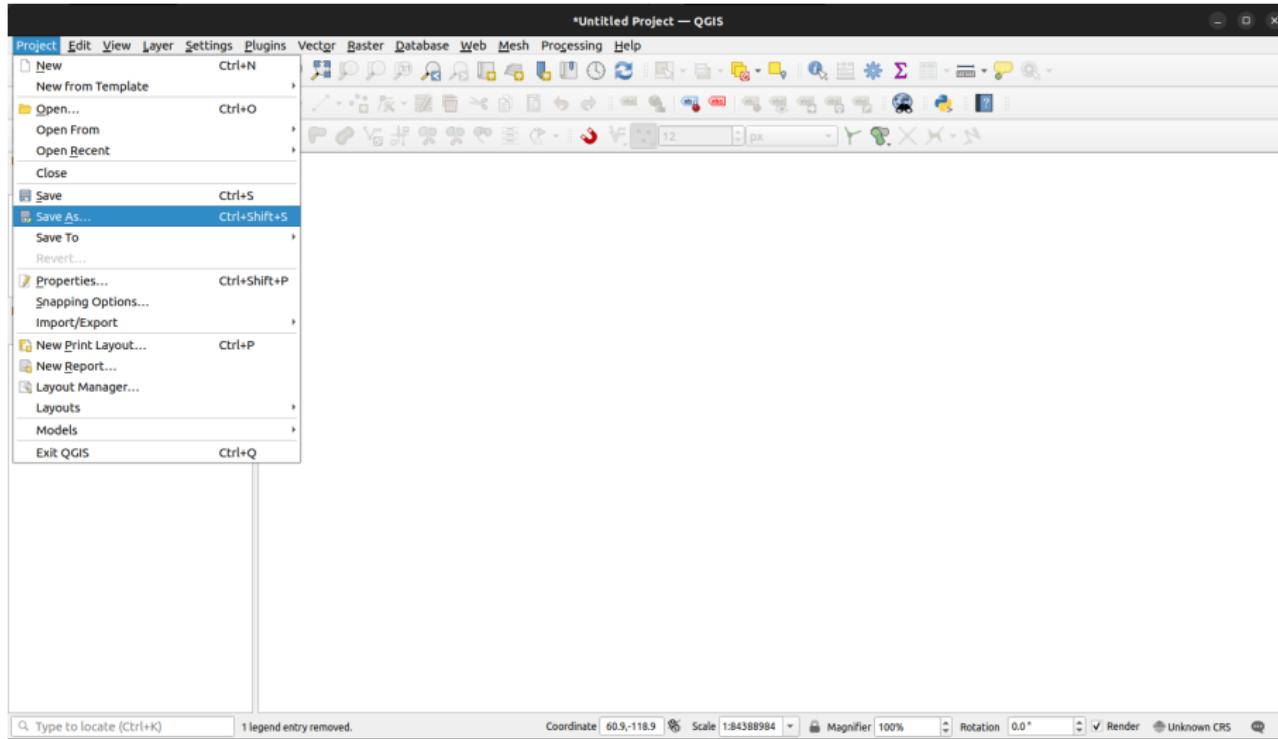

Here is the full list of data sources and links:

Category	Type	Format	Data source
Nighttime luminosity	Raster	.tif	VIIRS
Administrative units	Vector (polygons)	.geojson	geoBoundaries
Political violence	Table (non-geo)	.csv	UCDP GED

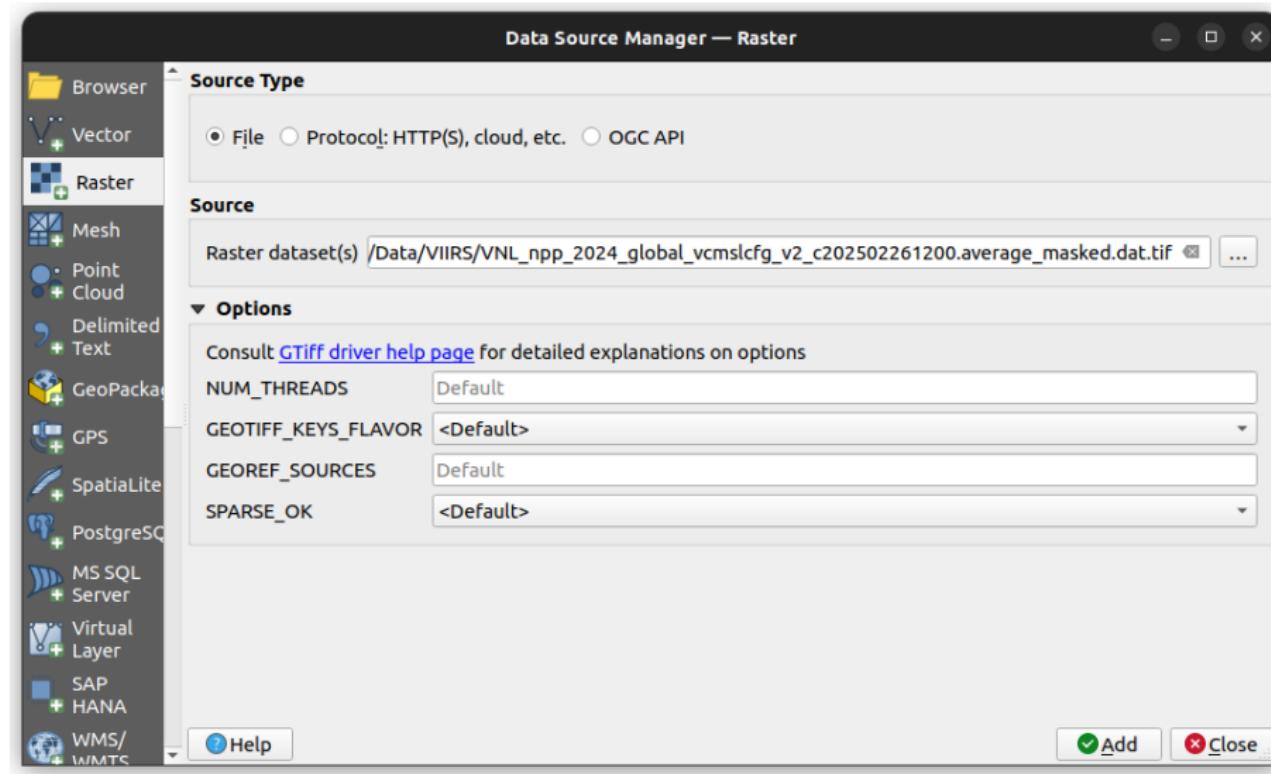

These are all in the Lab10WT02.zip file posted on Canvas.

Differences in Luminosity Across Countries (Korea and Hispaniola)

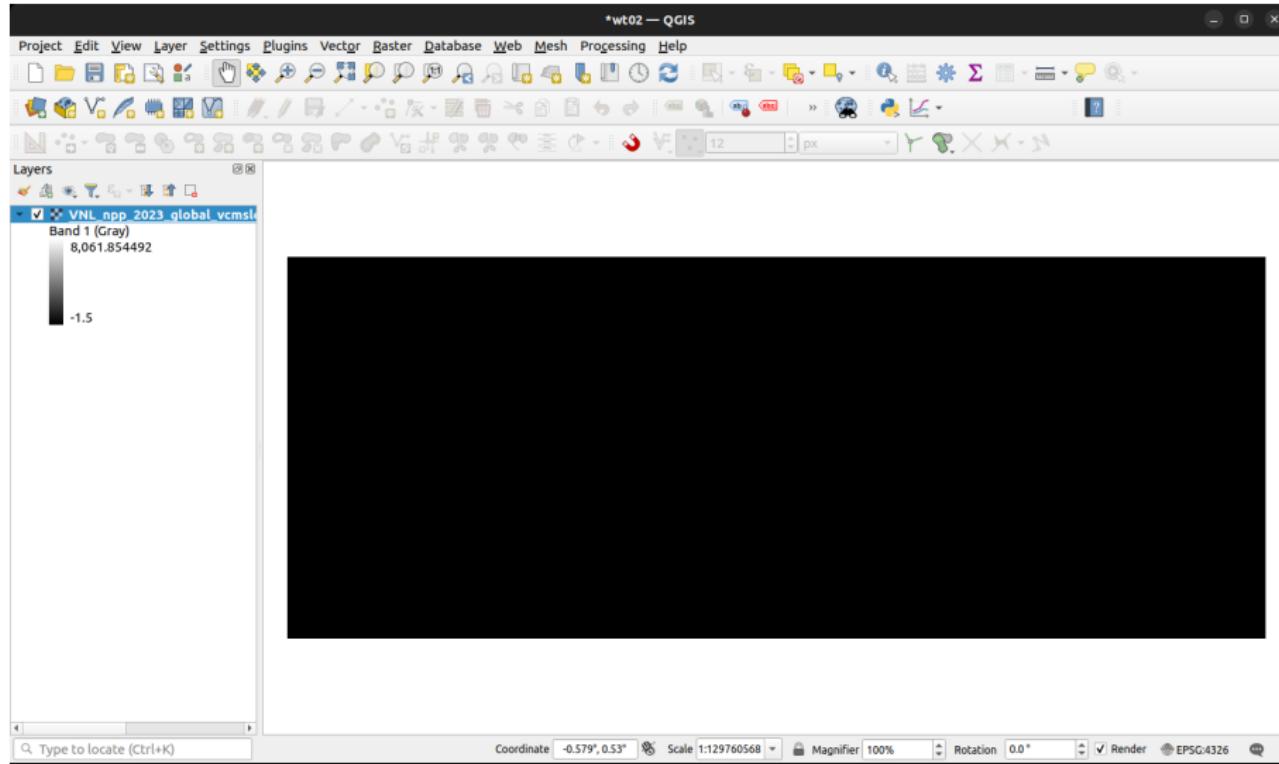

Always save your progress!
Go to Project → Save As...

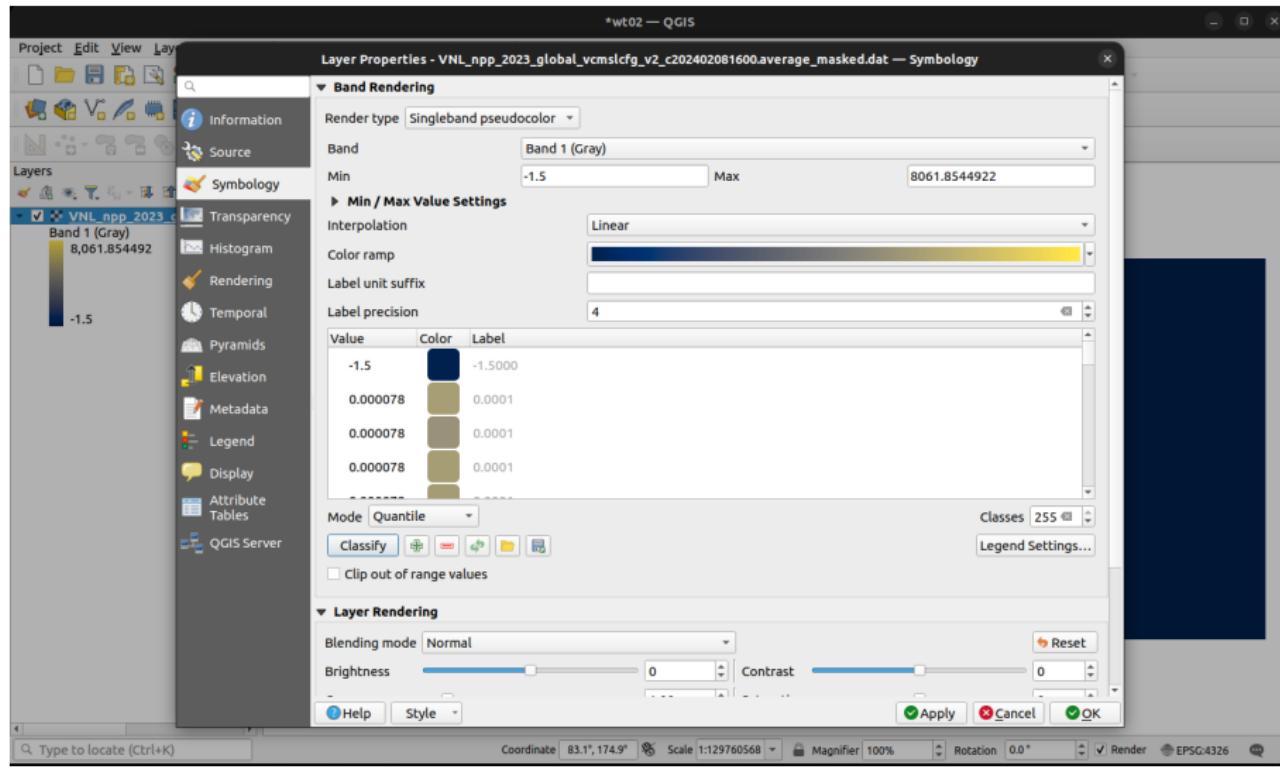

Vignette 1. Load the 2024 VNL data (Layer → Add Layer → Add Raster Layer). VNL_npp_2024_....tif file in Data/VIIRS folder

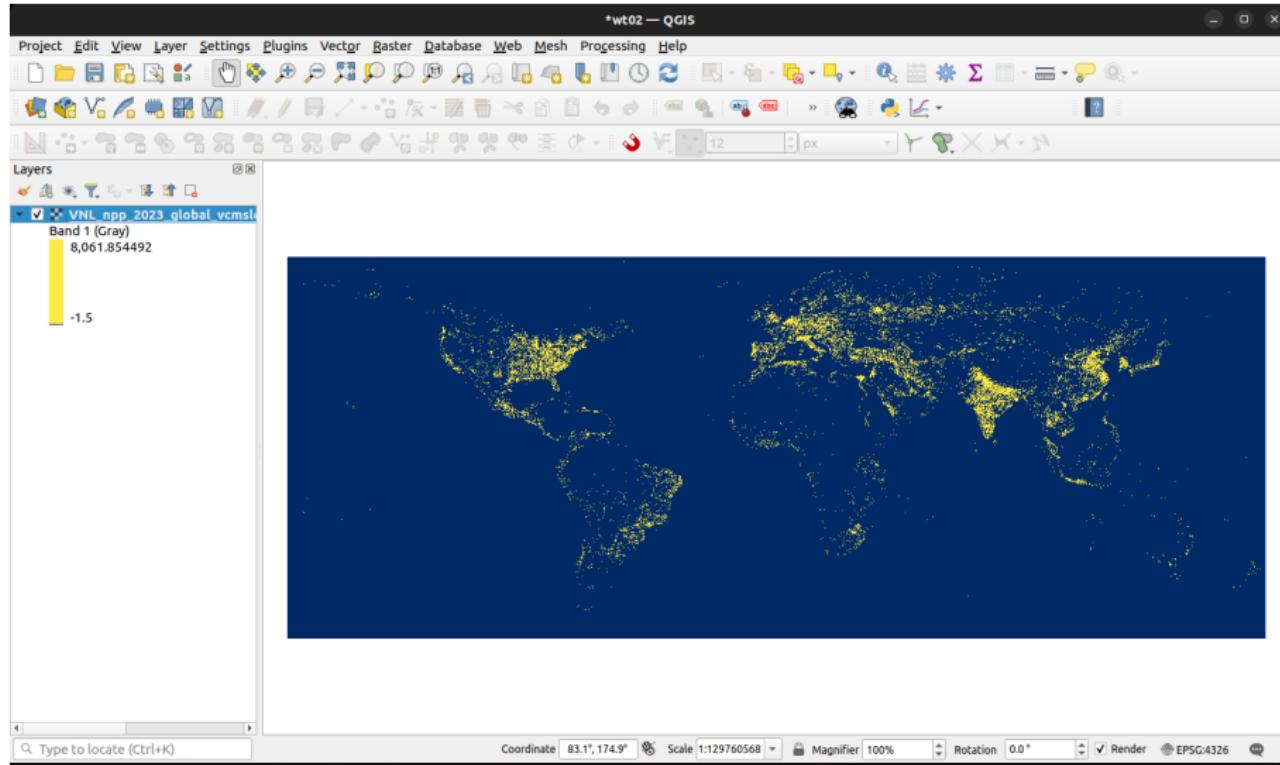

The default color scheme is too dark. Let's see if we can add some contrast

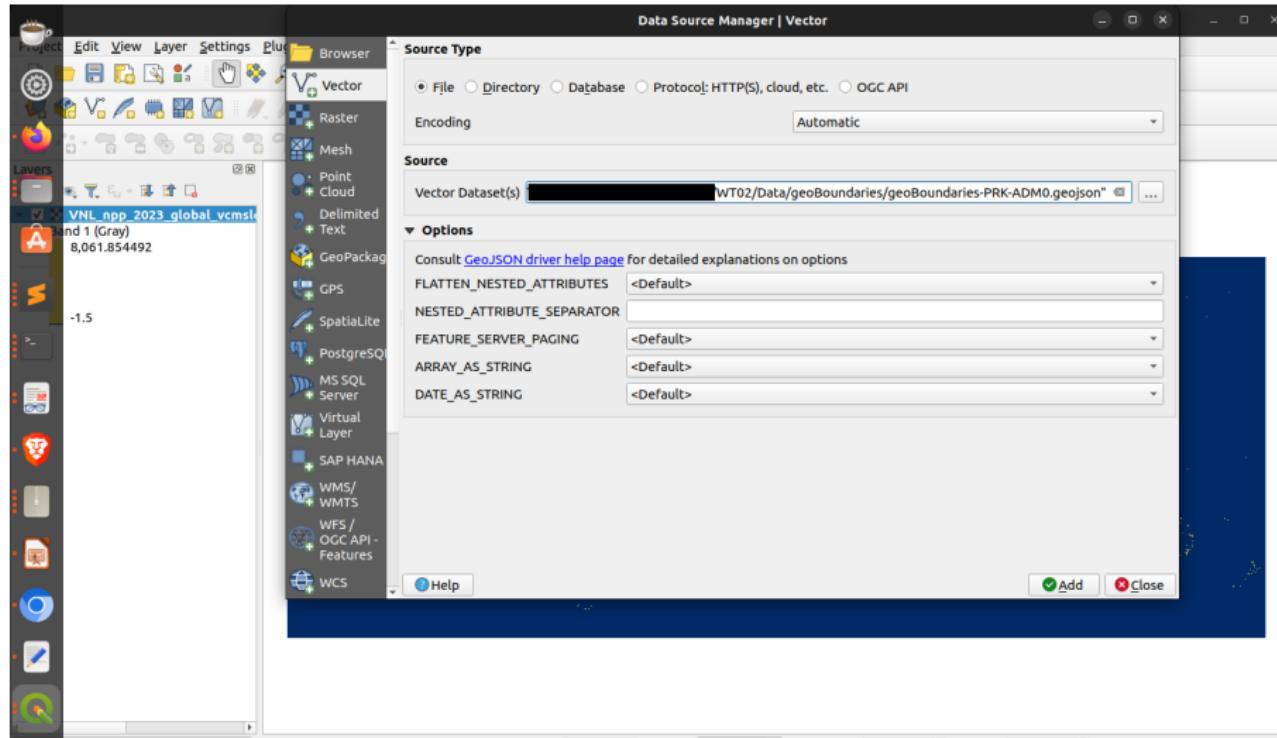

In the layer's Properties, change Render type to Singleband pseudocolor and set Mode to Quantile. Click Classify and OK

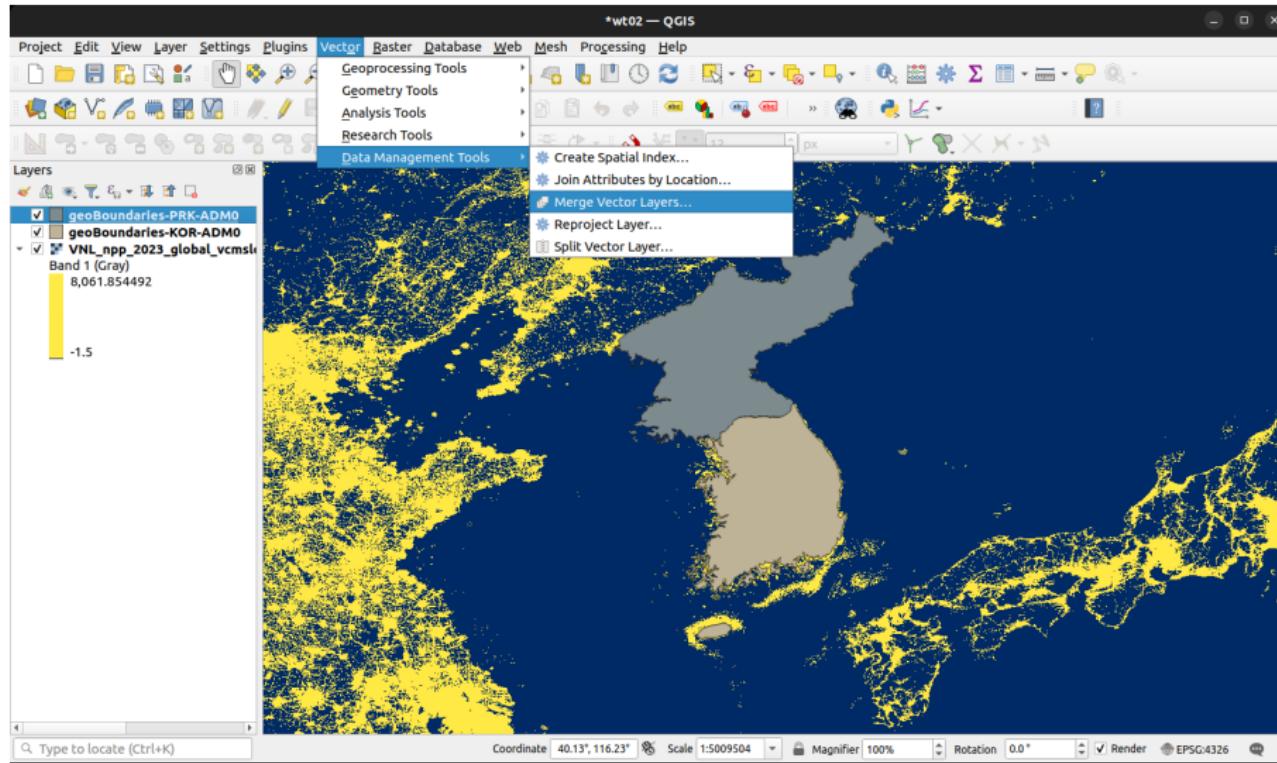

This is probably too much contrast, but at least we can see the distribution

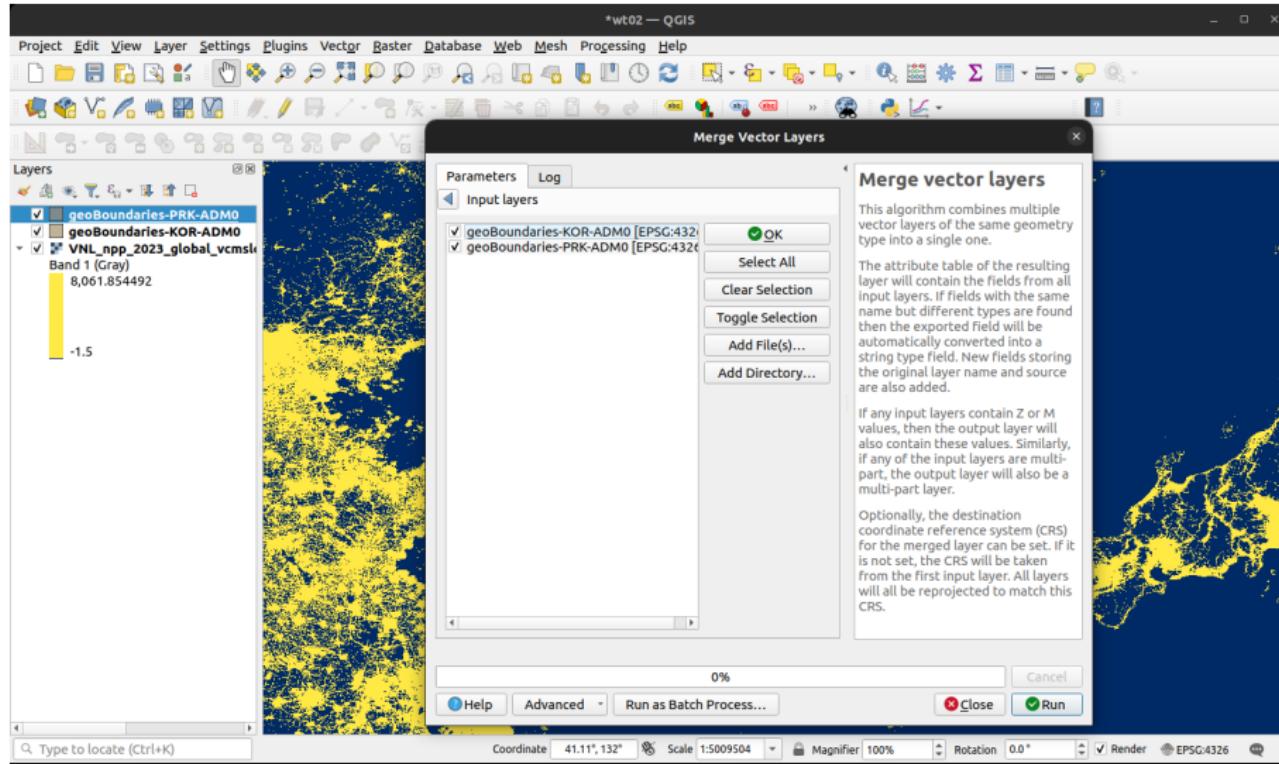

Load country boundaries for the two Koreas (Layer → Add Layer → Add Vector Layer). 2 files: geoBoundaries-PRK-ADM0.geojson and geoBoundaries-KOR-ADM0.geojson from Data/geoBoundaries folder.

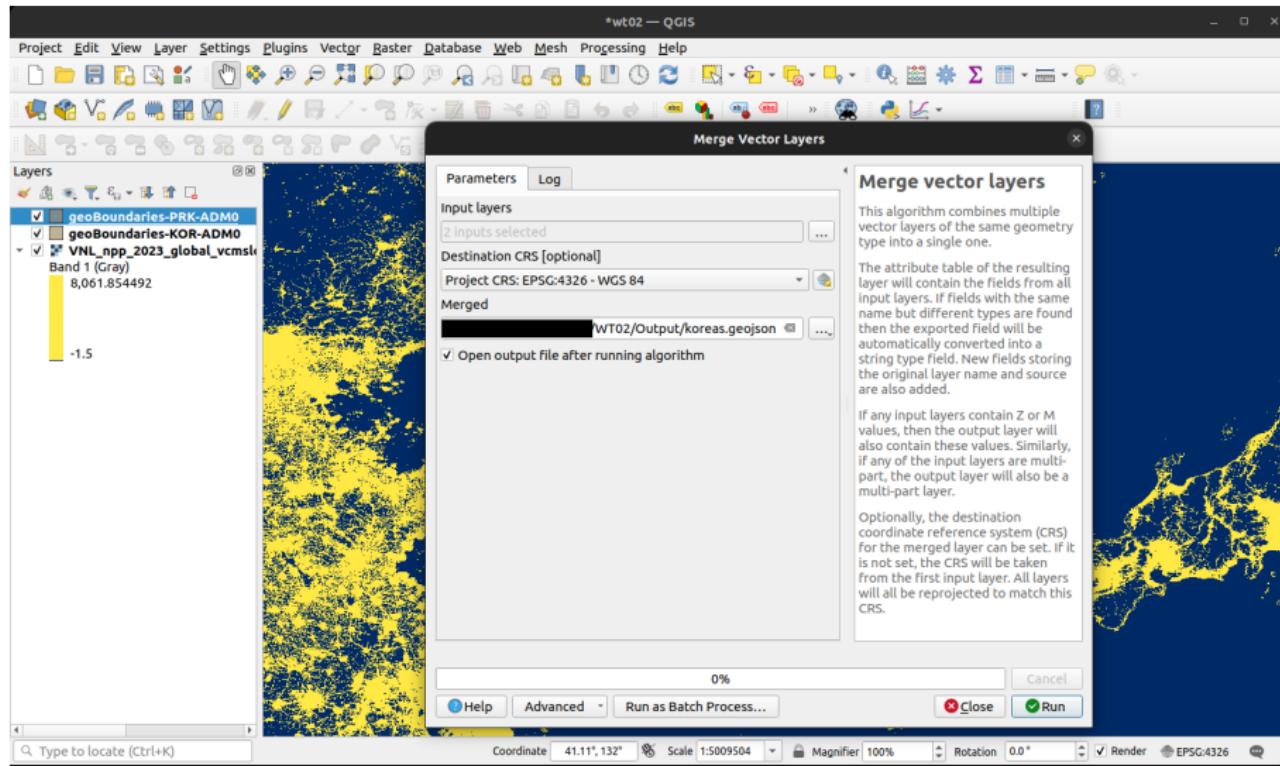

Let's merge the two Koreas into a single layer (Vector menu → Data Management Tools → Merge Vector Layers...)

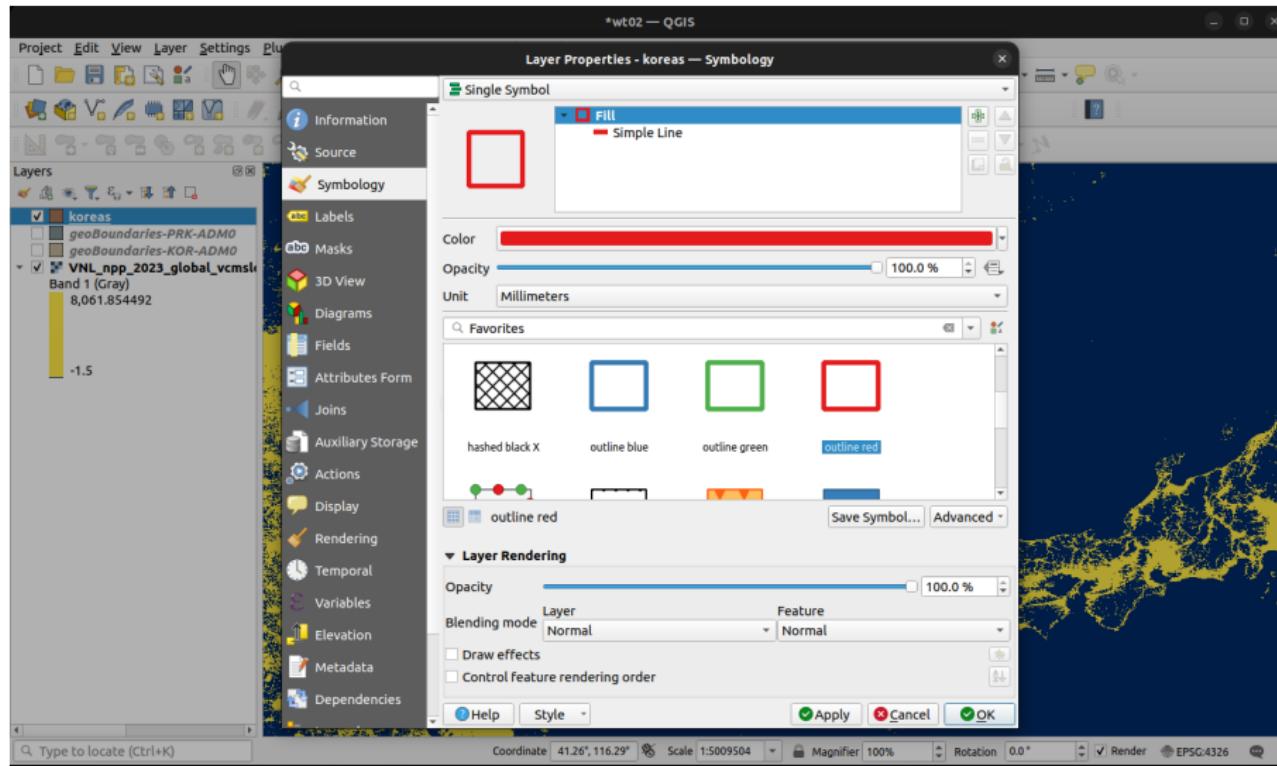

Input layers = geoBoundaries-KOR-ADMO and geoBoundaries-PRK-ADMO

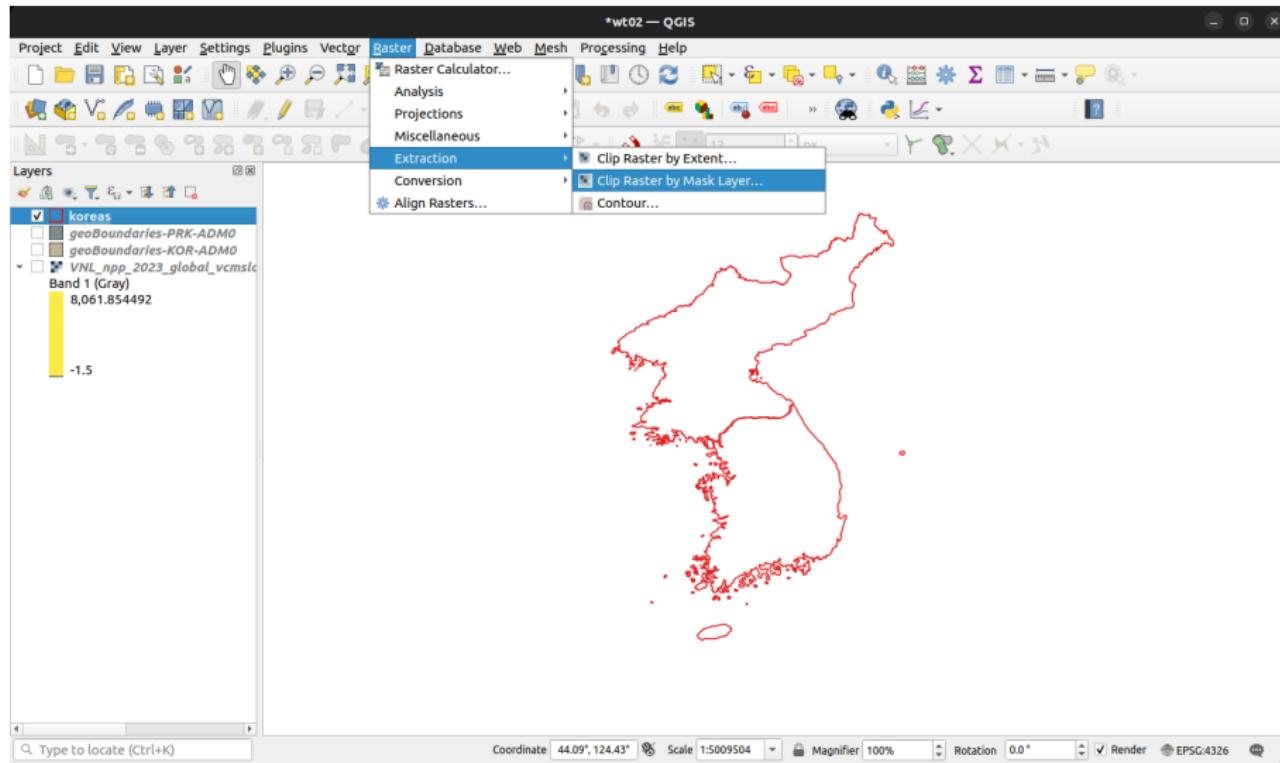

Save the merged file as koreas.geojson

Change the symbology of the new layer, to make all but the borders transparent

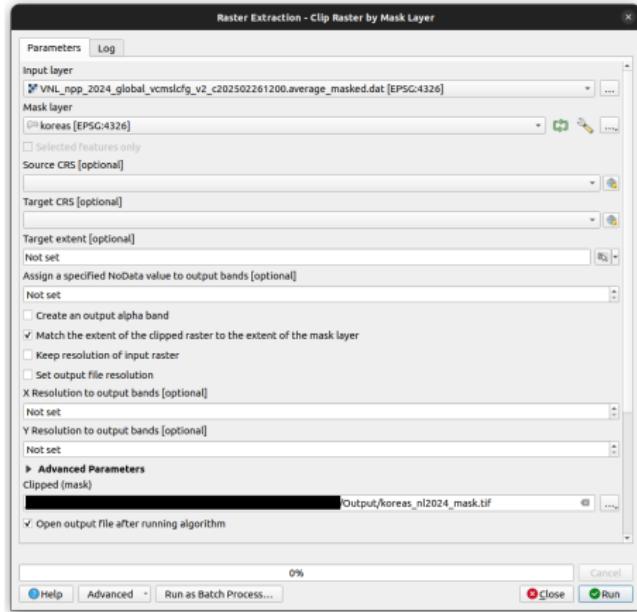

Let's extract the part of the global VNL raster that overlaps with the Koreas.
Go to Raster menu → Extraction → Clip Raster by Mask Layer...

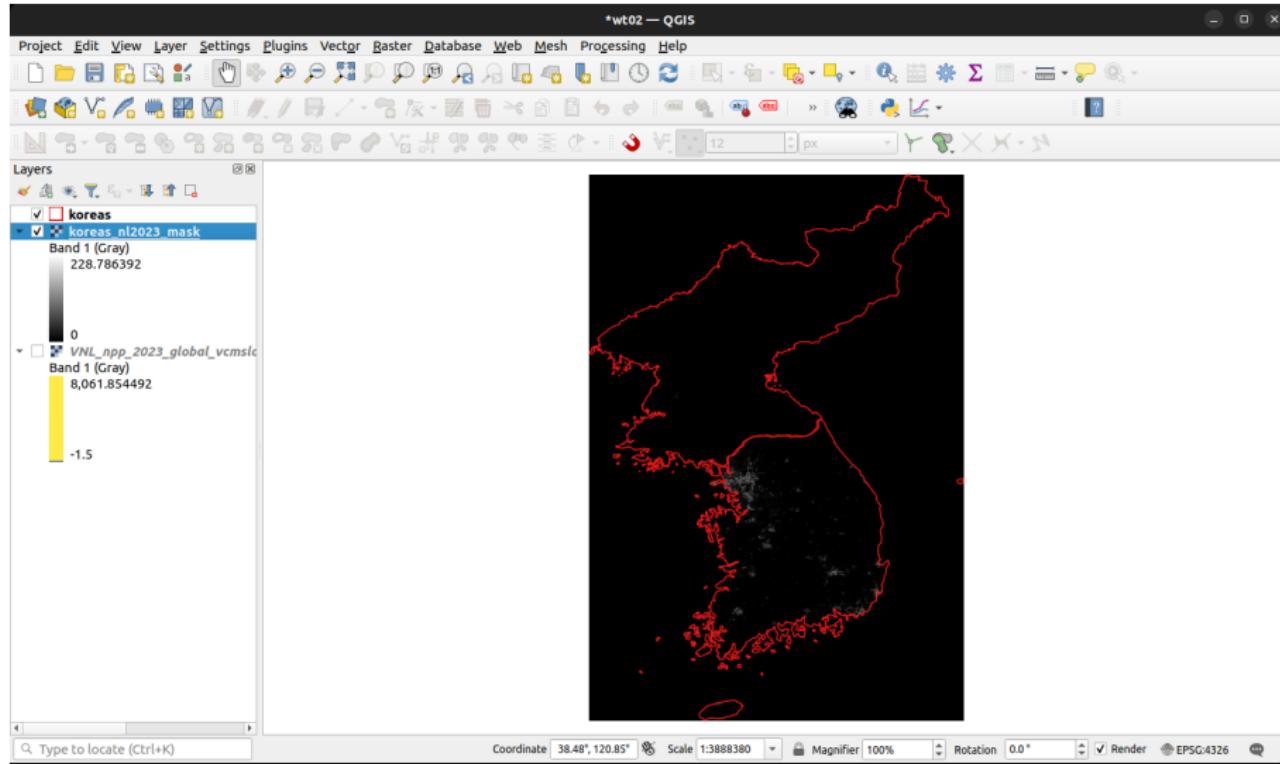

Set parameters

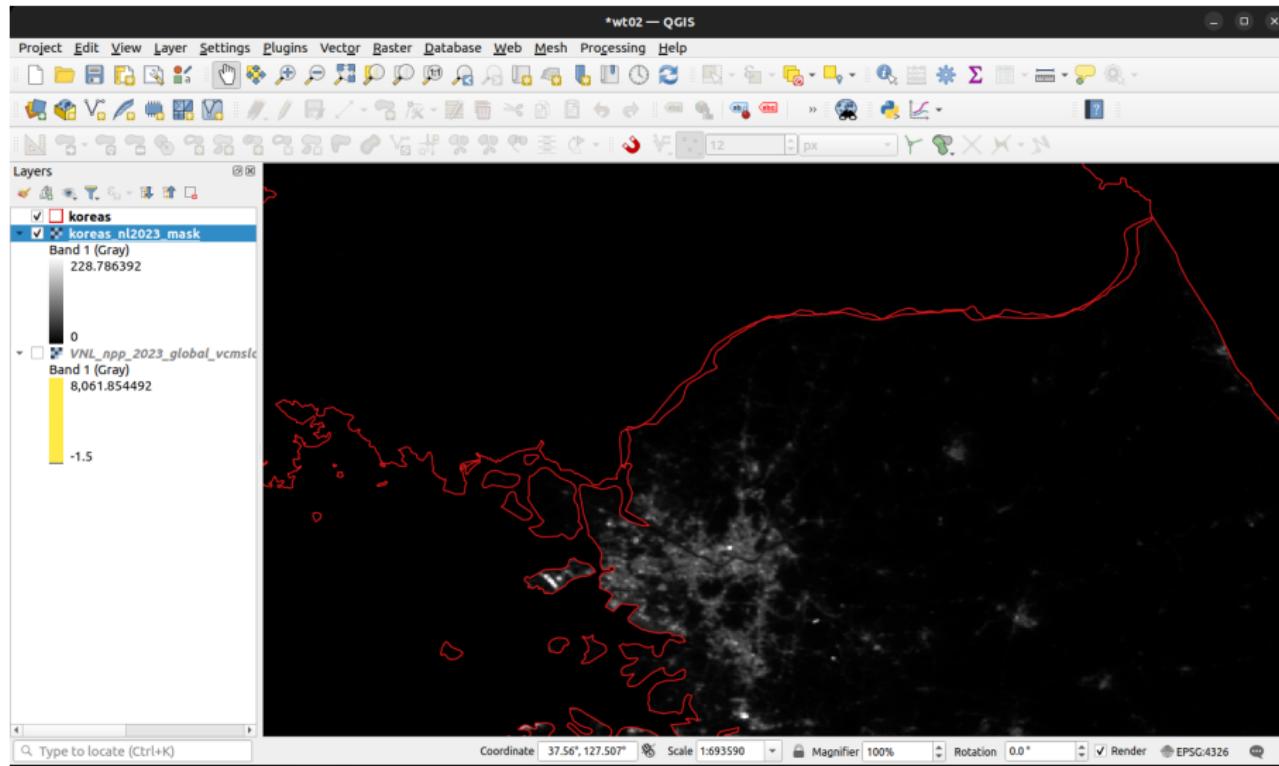

- Input layer = VNL_npp_2024...
- Mask layer = koreas
- ✓ Match the extent of the clipped raster to the extent of the mask layer
- Save file as koreas_nl2024_mask.tif

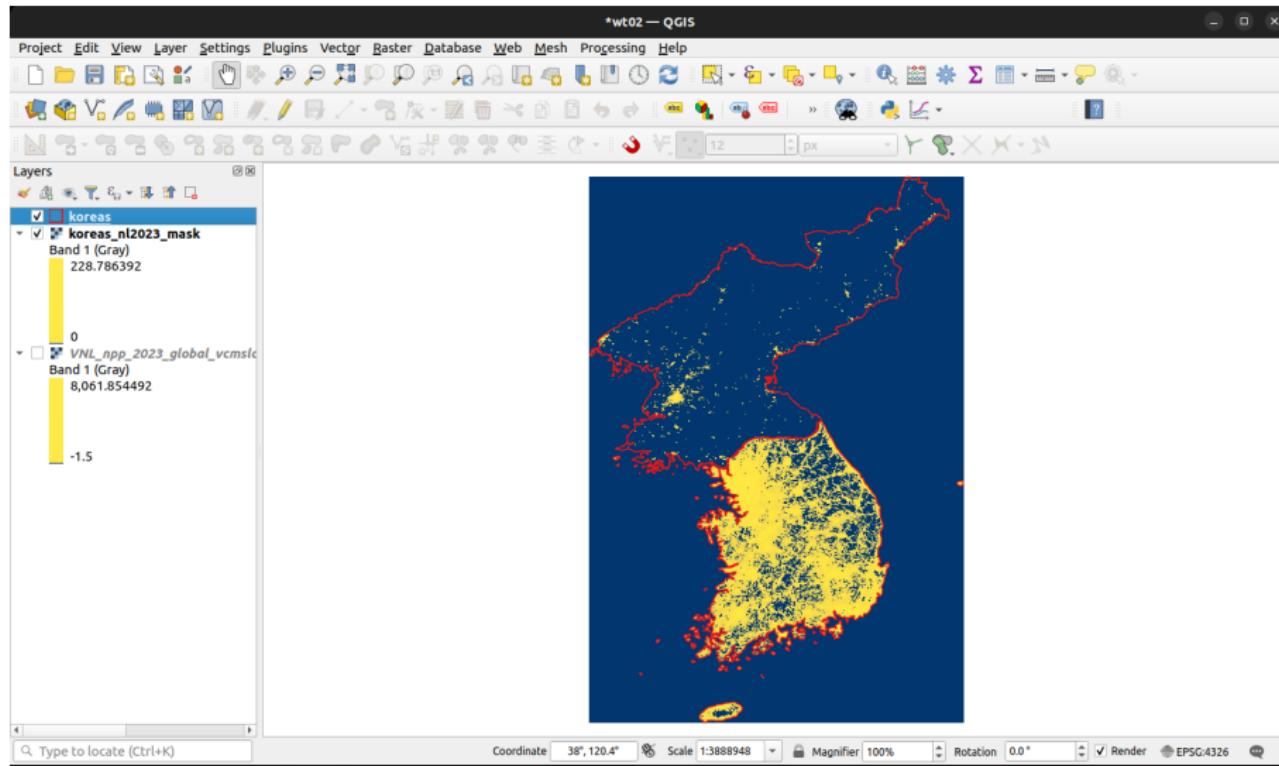

The clipped raster should look something like this

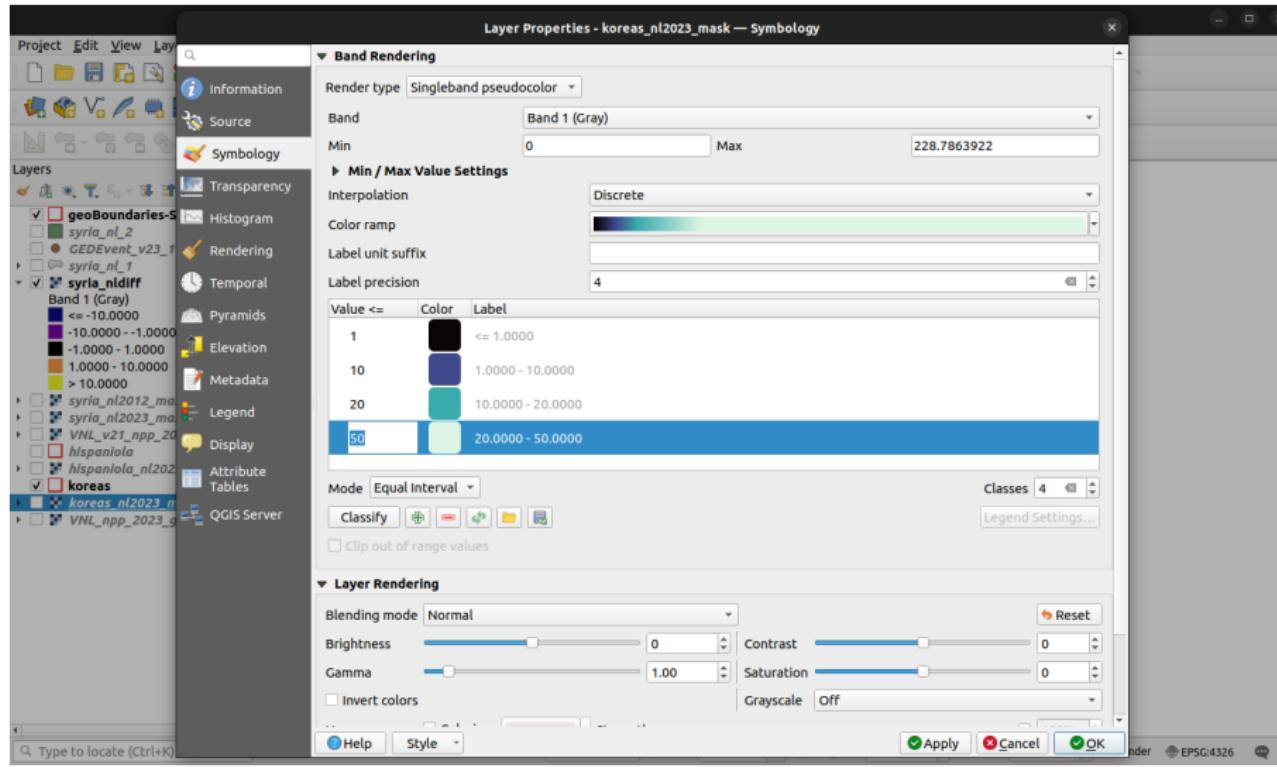

You can zoom in to see Seoul in greater detail

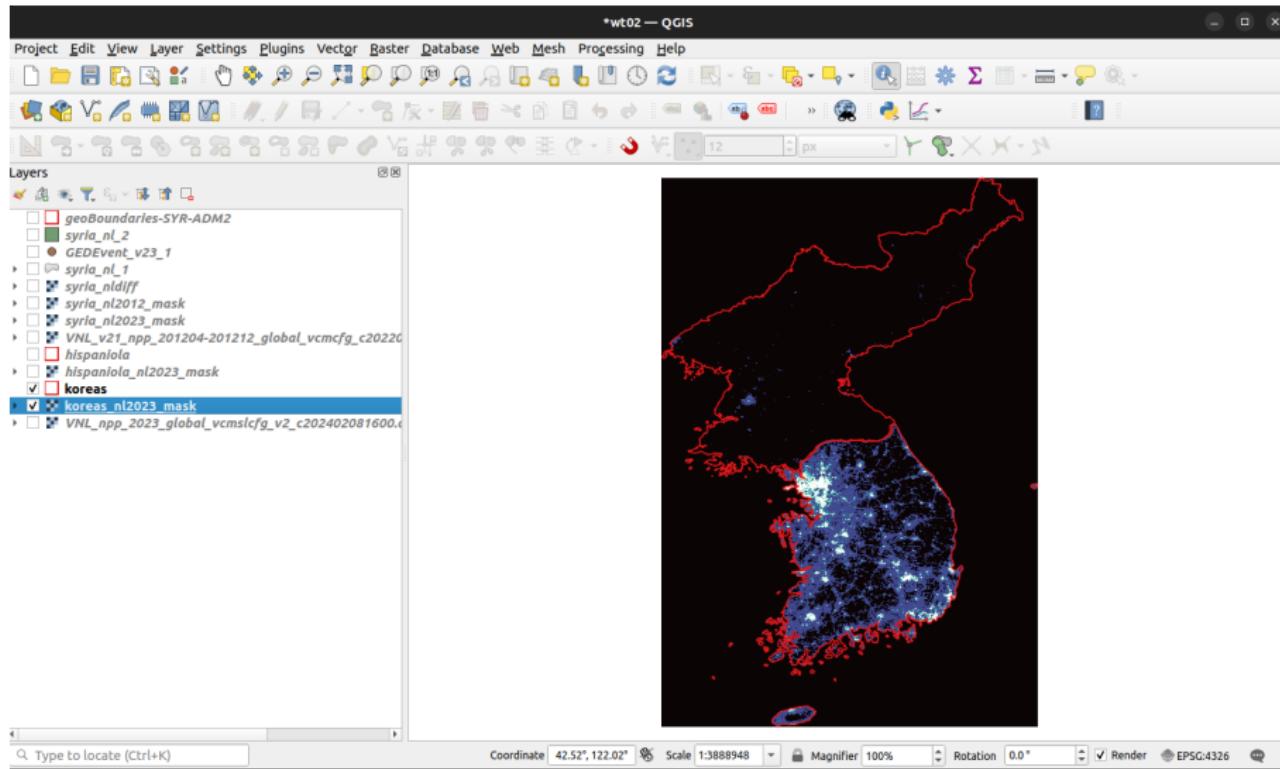

Change color scheme to Singleband pseudocolor, Quantile again for contrast

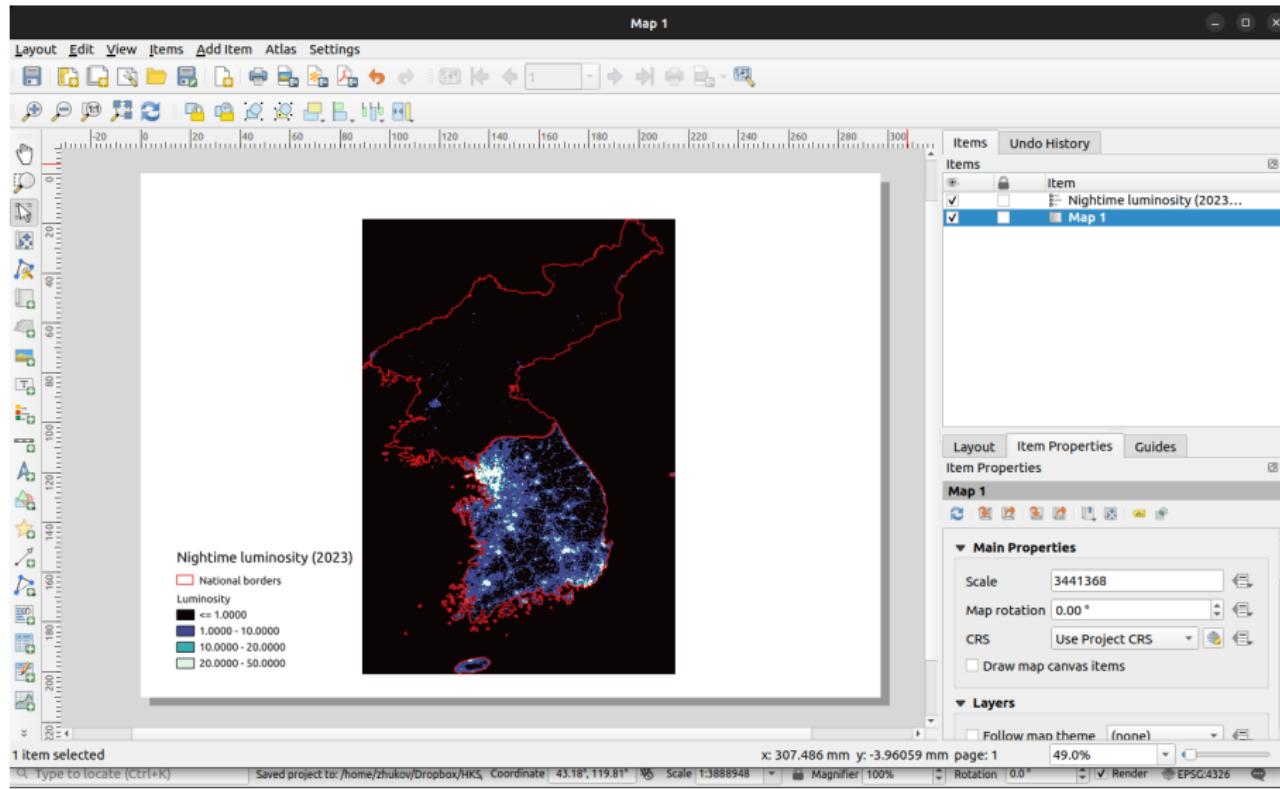

General tip: set Interpolation = Discrete, Mode = Equal interval and manually edit the cutpoints like this

This way, you can customize the appearance of the map for your needs

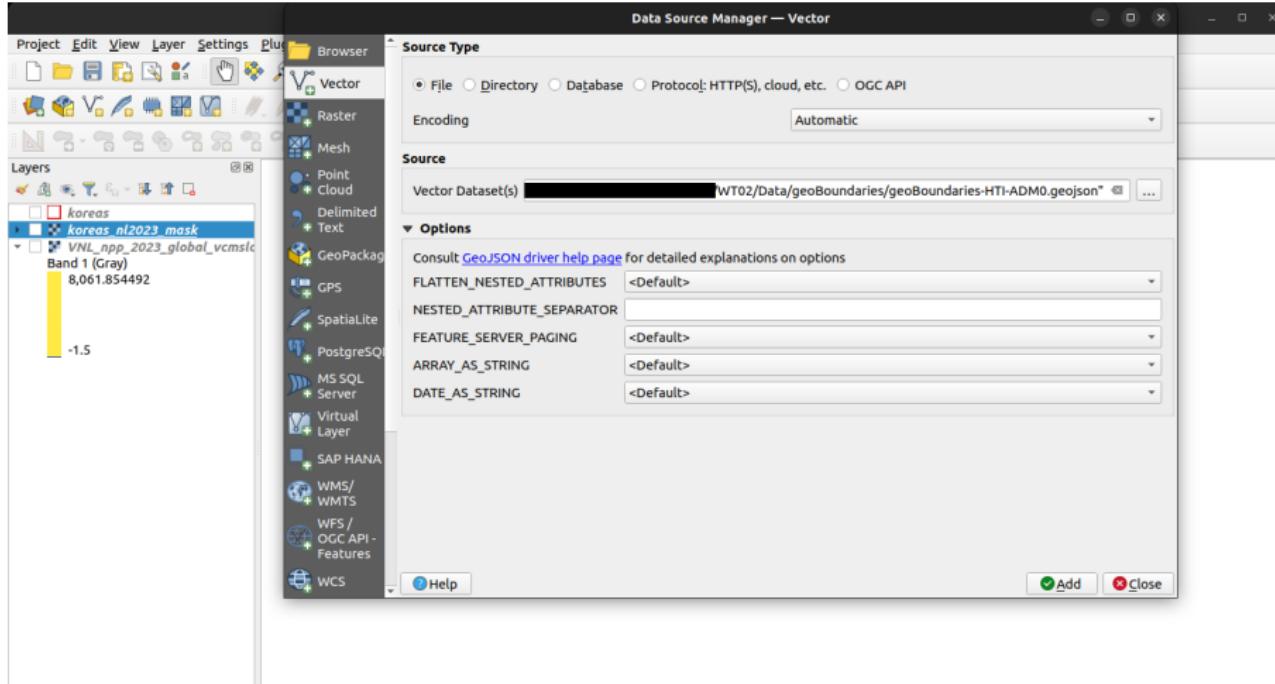

This map is ready to be exported (you know how to do this)

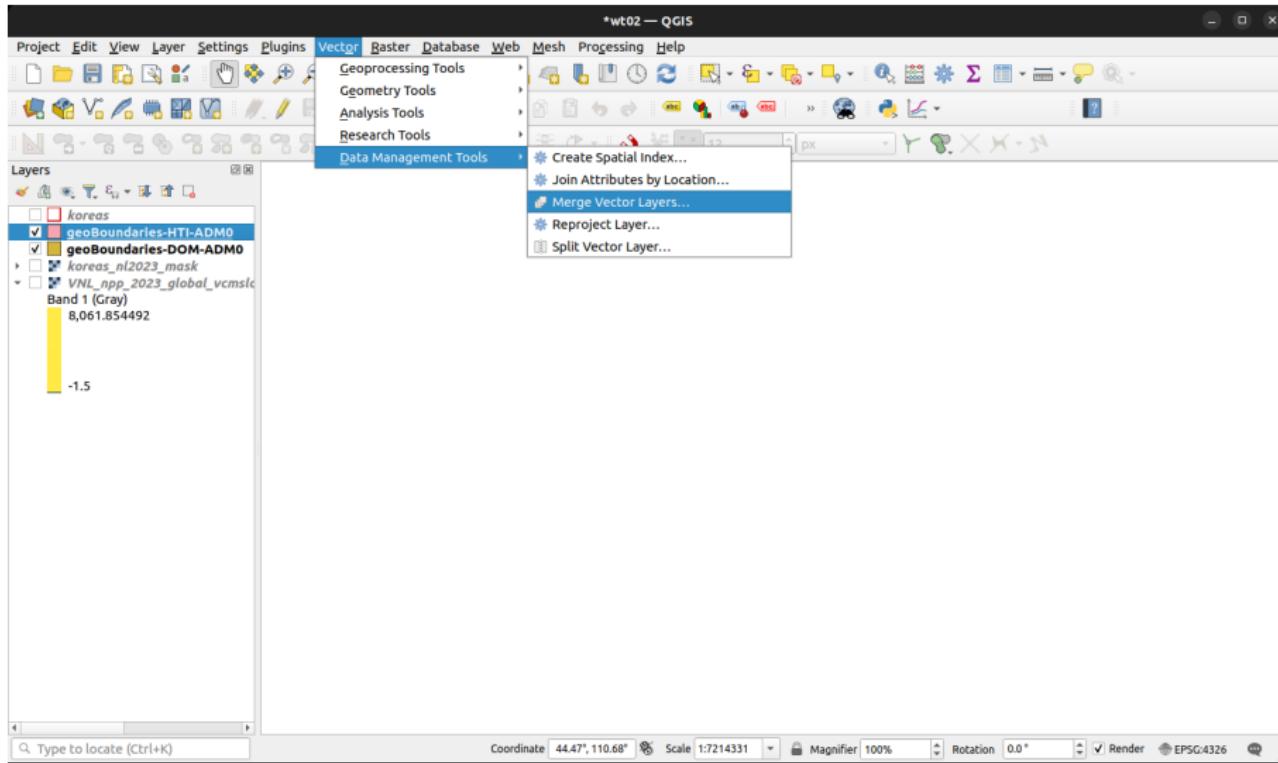

Now for **Vignette 2**, let's repeat this process for the island of Hispaniola.

Load *country boundaries* for Haiti and the Dominican Republic (2 files:

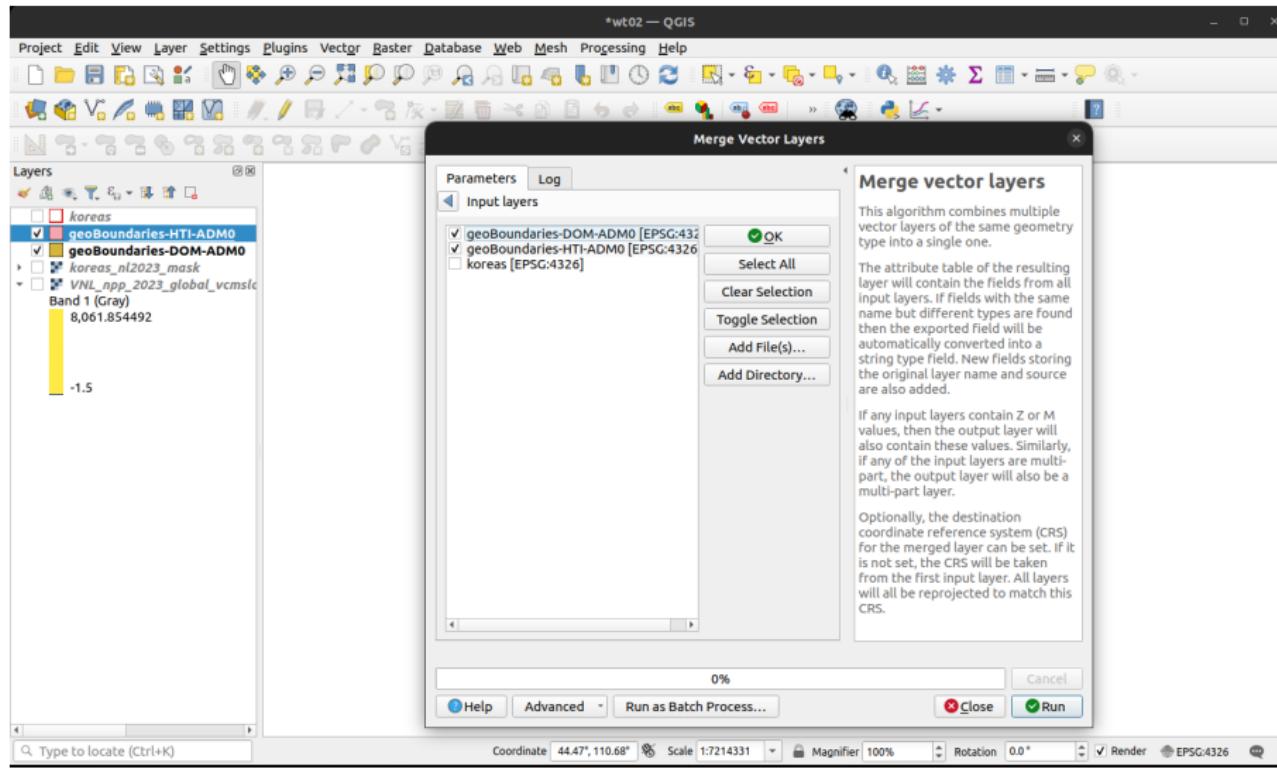

geoBoundaries-HTI-ADM0.geojson and geoBoundaries-DOM-ADM0.geojson from Data/geoBoundaries).

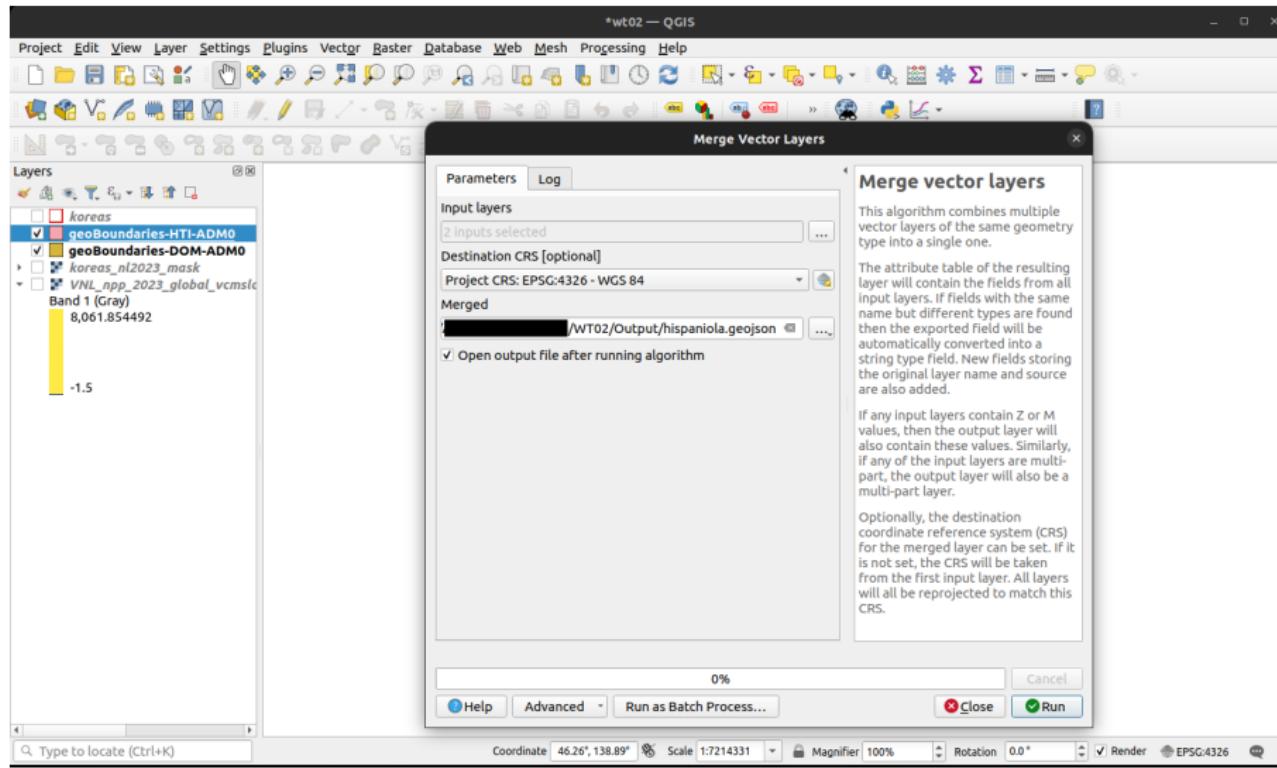

Once loaded, let's merge the two countries into a single layer again (Vector menu → Data Management Tools → Merge Vector Layers...)

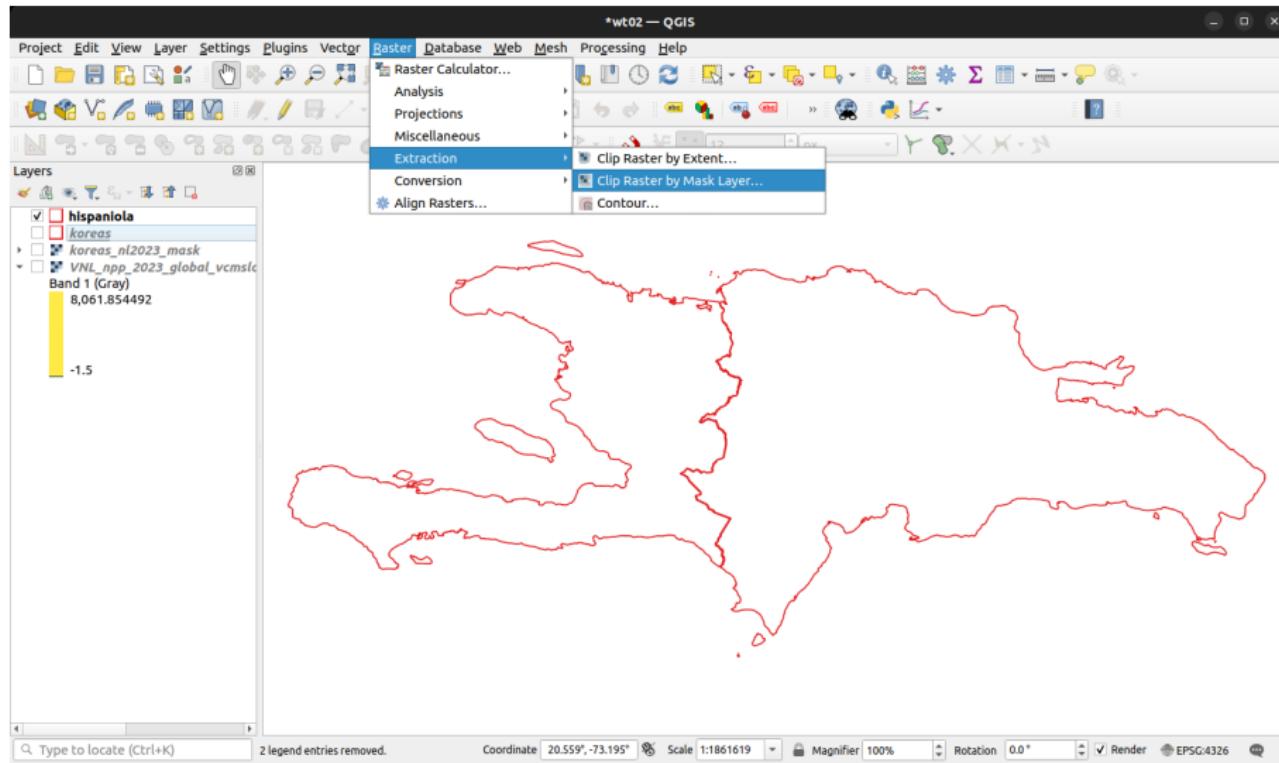

Input layers = geoBoundaries-DOM-ADMO and geoBoundaries-HTI-ADMO

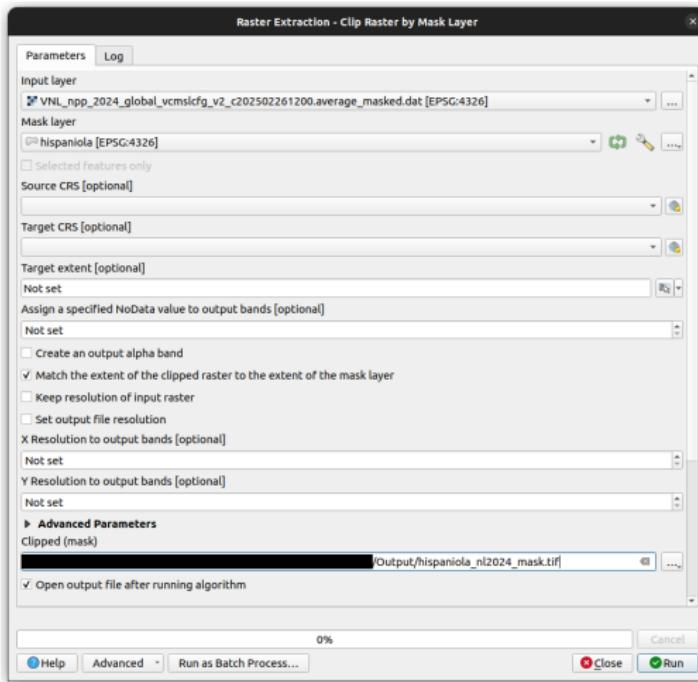

Save the merged file as hispaniola.geojson

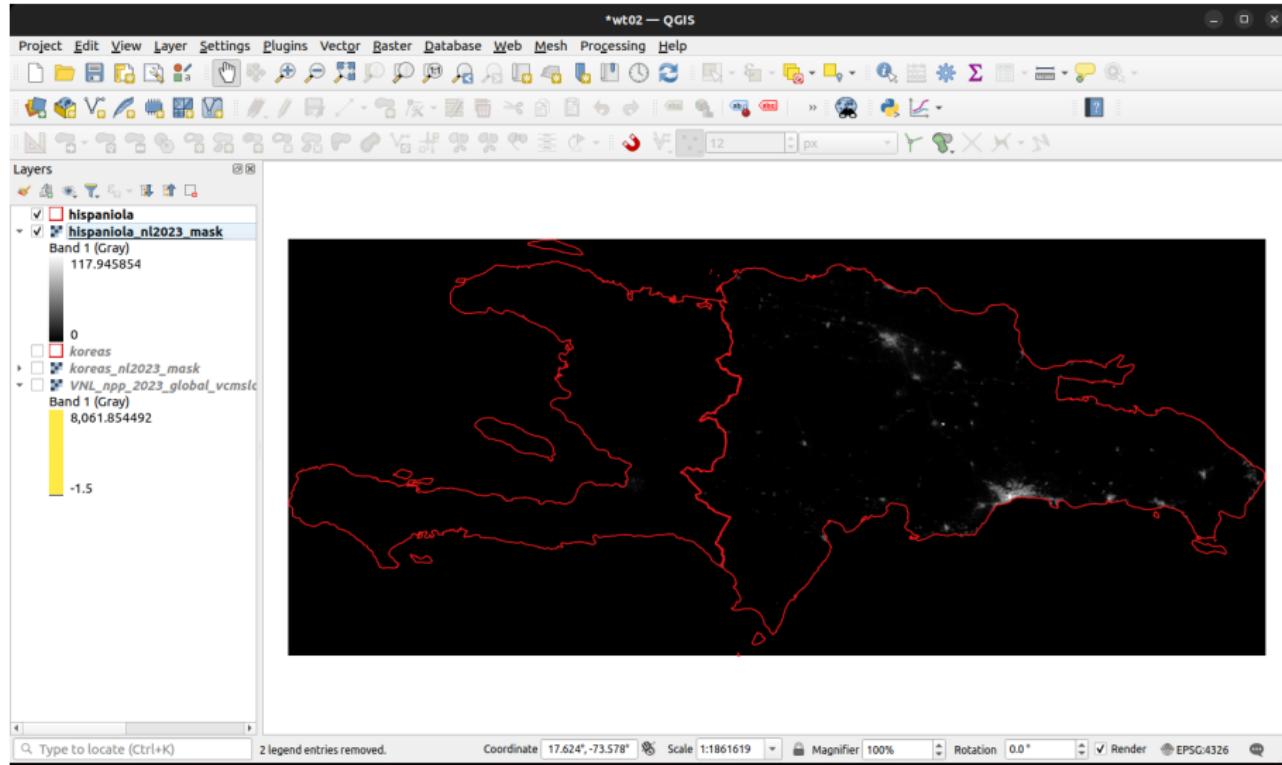

Let's extract the part of the global VNL raster that overlaps with the island.
Go to Raster menu → Extraction → Clip Raster by Mask Layer...

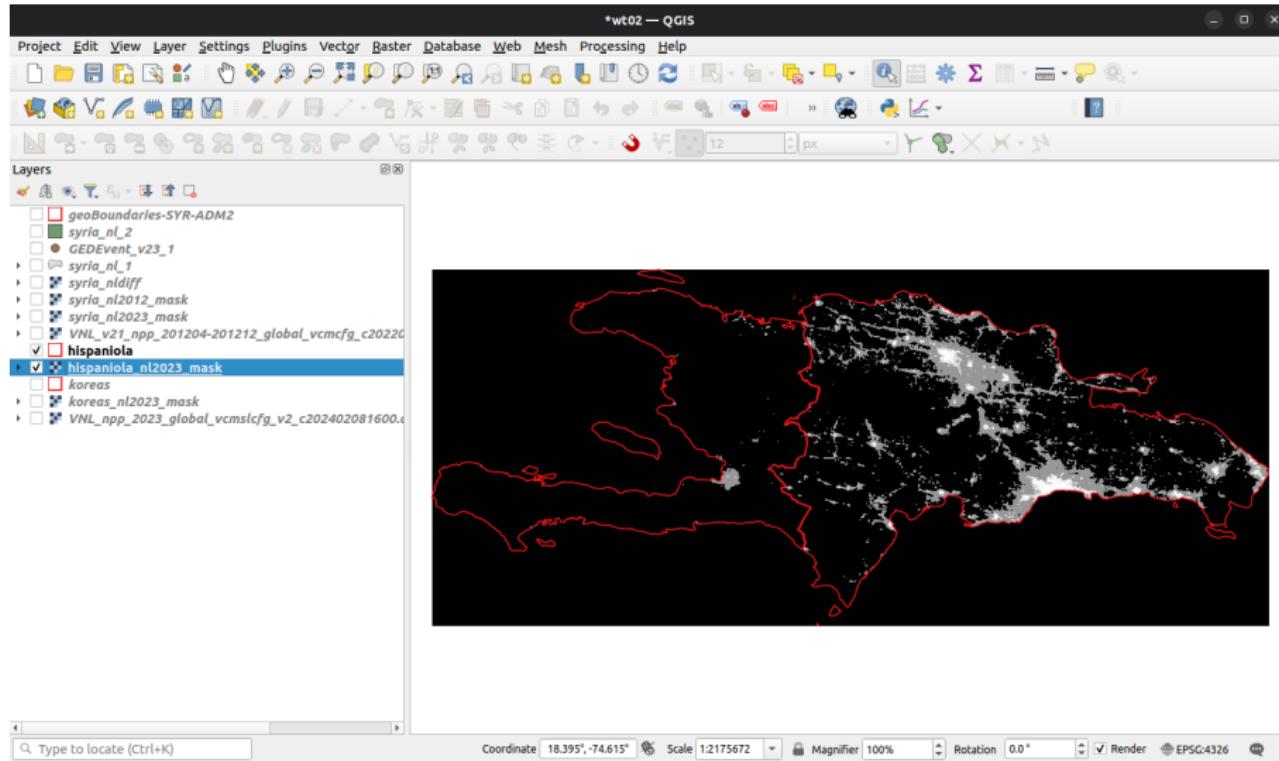

Set Input layer = VNL_npp_2024..., Mask layer = hispaniola. Save file as hispaniola_nl2024_mask.tif

The clipped raster should look something like this

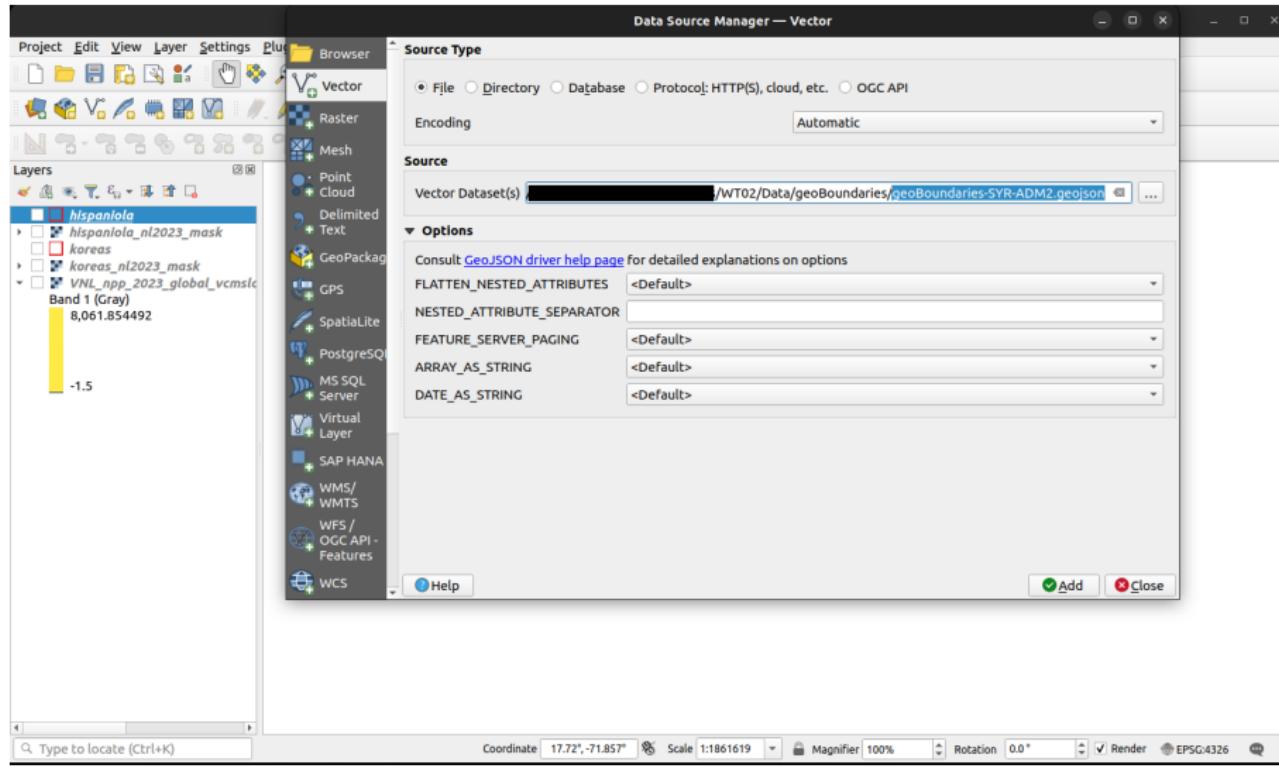

Customize the color ramp and export the map (just like last time)

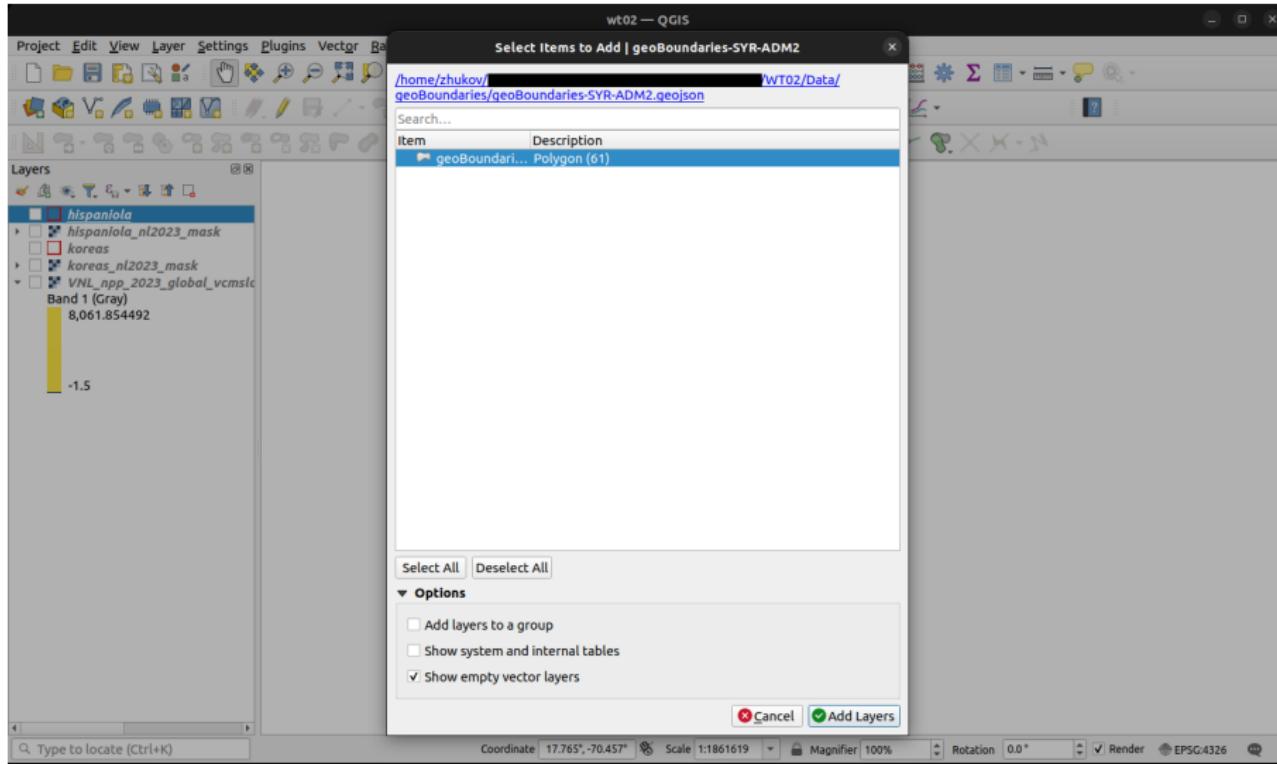

Differences in Luminosity Over Time (Syrian Civil War)

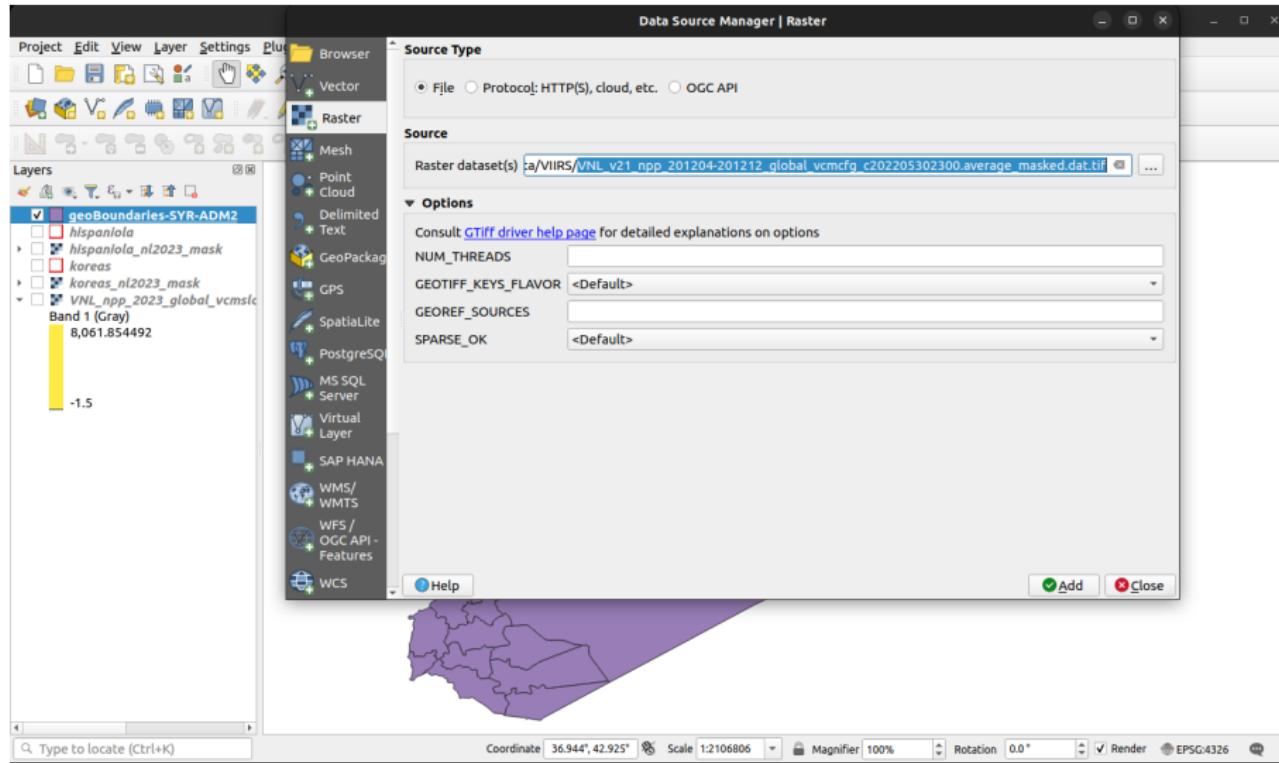

Vignette 3! Load *administrative boundaries* for Syria. File is geoBoundaries-SYR-ADM2.geojson from Data/geoBoundaries folder.

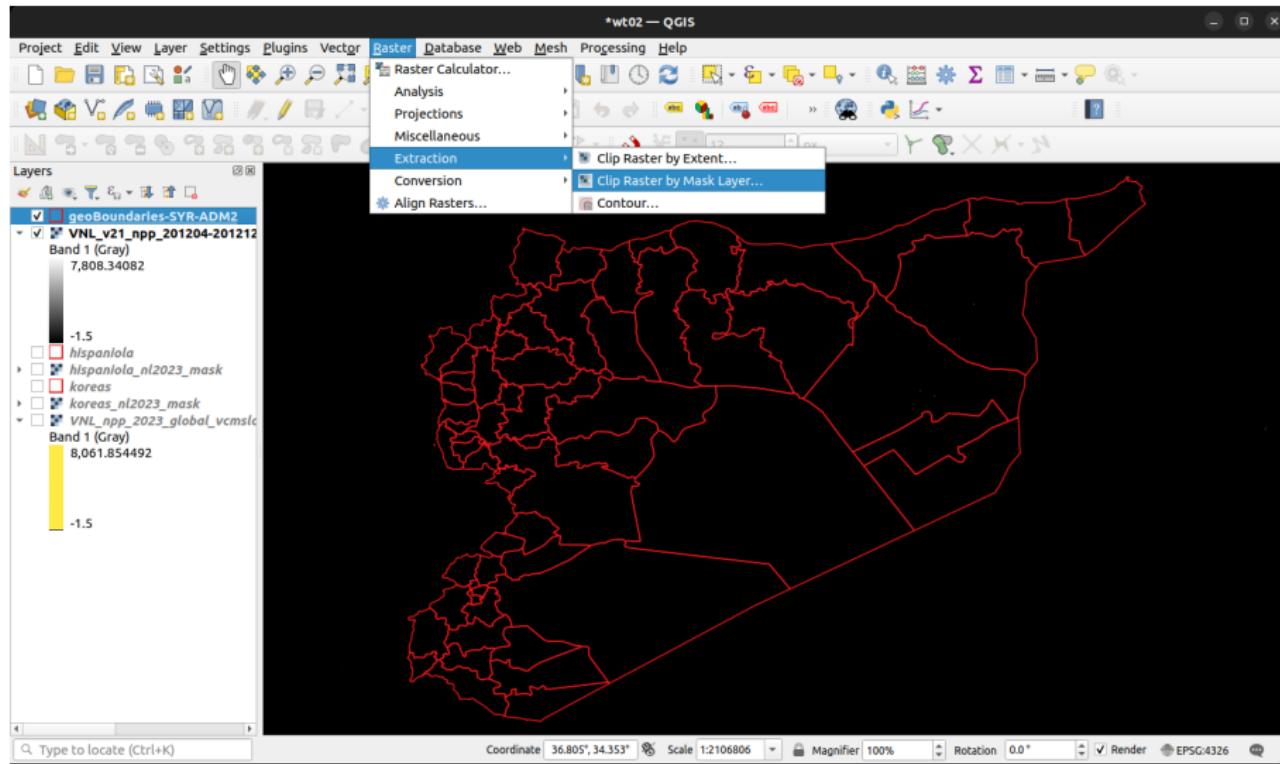

You may see a “Select Items to Add” screen after clicking Add. Click Add Layers

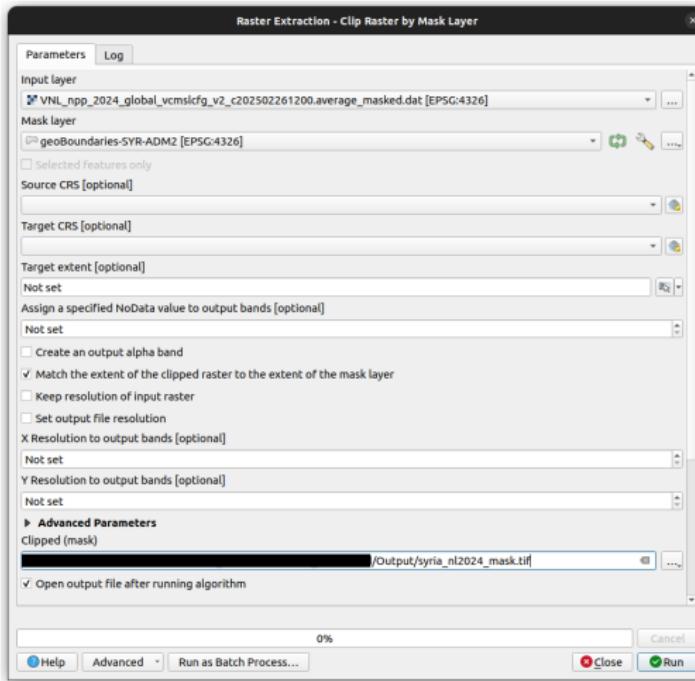

To compare current luminosity to a period earlier in the Syrian Civil War, load the *2012 VNL data (VNL_v21_npp_201204....tif* file in Data/VIIRS folder)

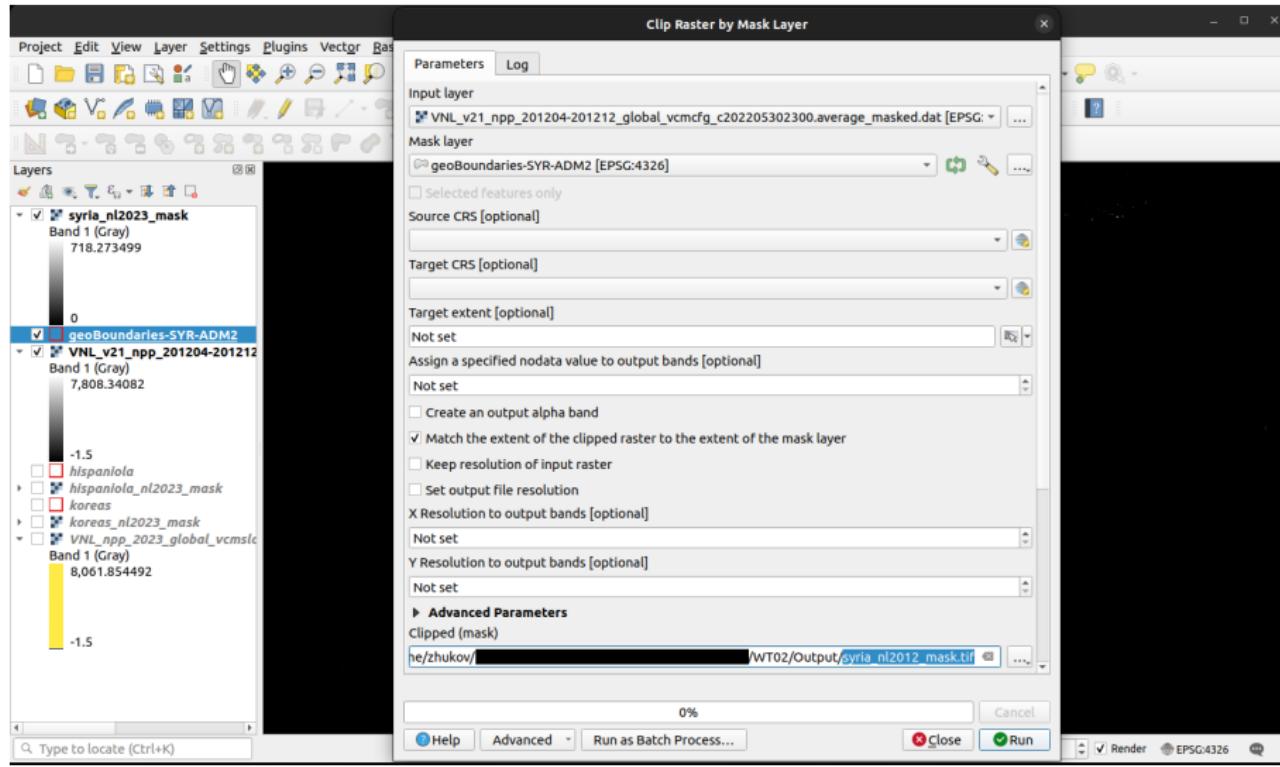

Let's extract the parts of both the 2024 and 2012 global VNL rasters that overlap with Syria. Raster menu → Extraction → Clip Raster by Mask Layer...

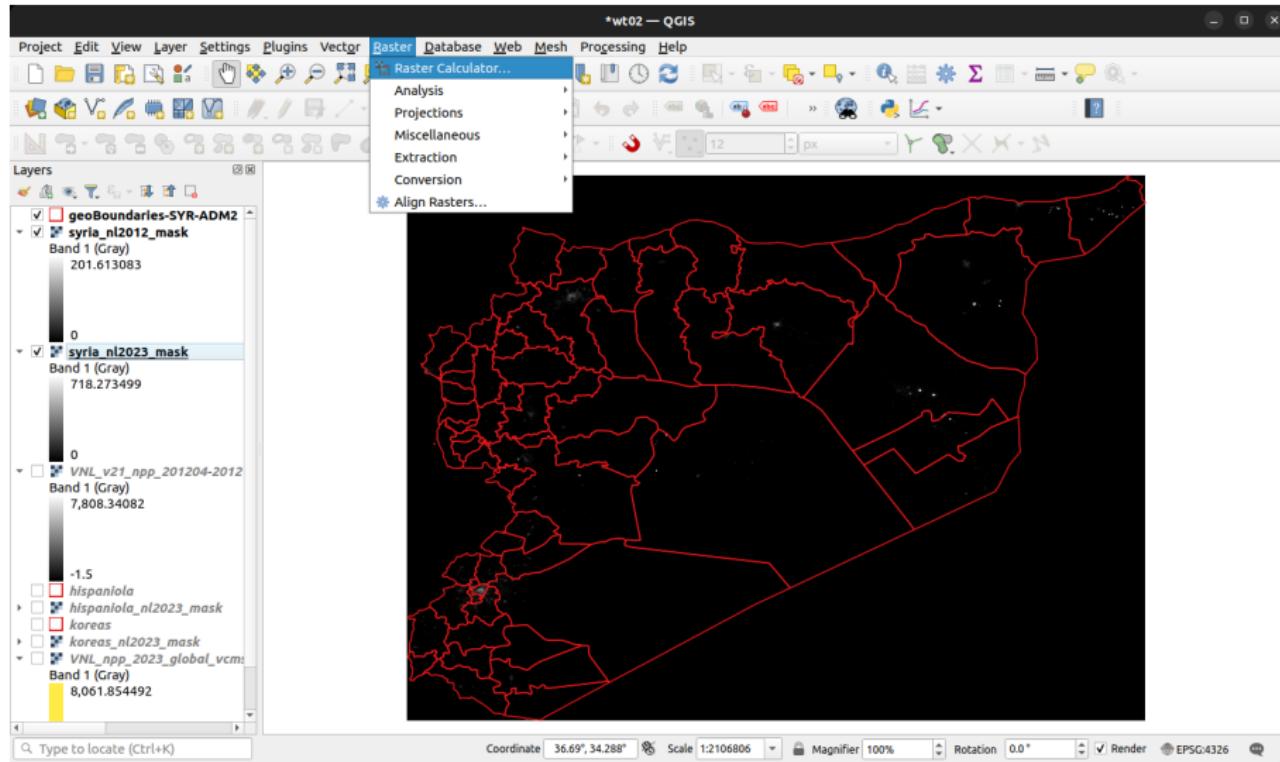

Set Input layer = VNL_npp_2024..., Mask layer = geoBoundaries-SYR-ADM2. Save file as syria_nl2024_mask.tif

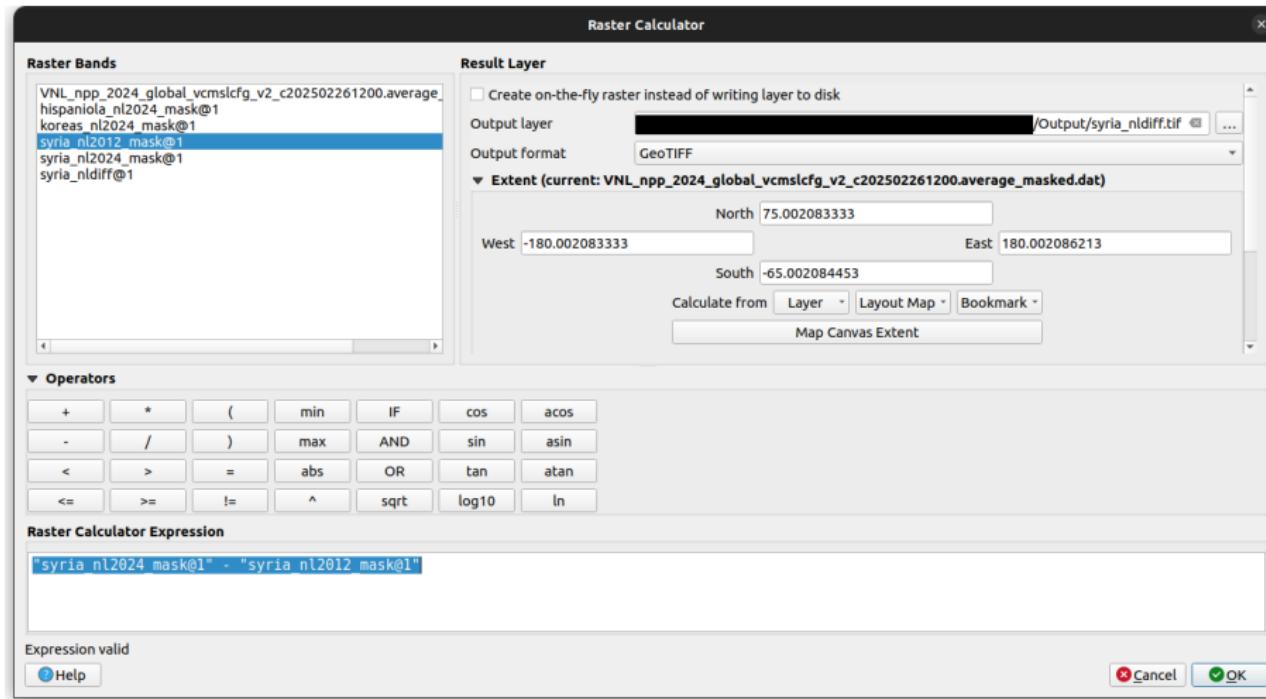

Repeat with Input layer = VNL_v21_npp_2012..., Mask layer = geoBoundaries-SYR-ADM2. Save file as syria_nl2012_mask.tif

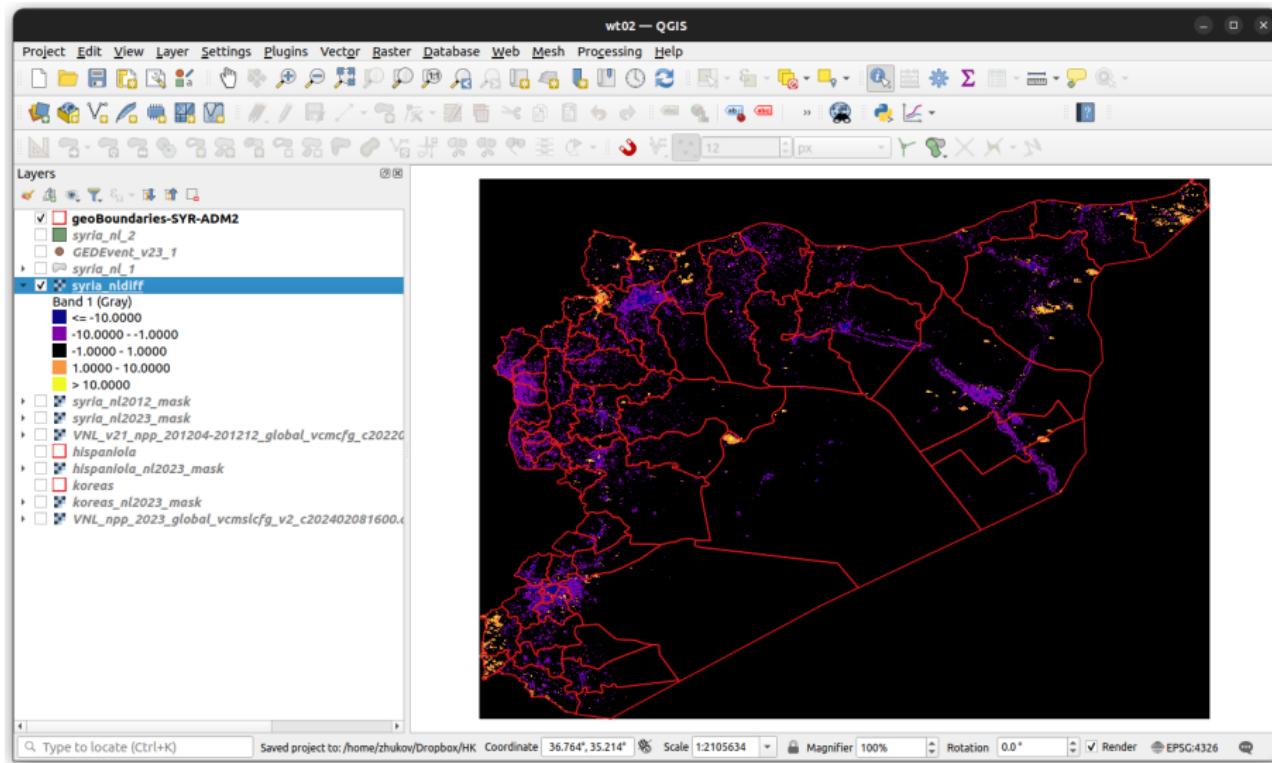

Let's now calculate the difference between 2024 and 2012. Go to Raster menu → Raster Calculator...

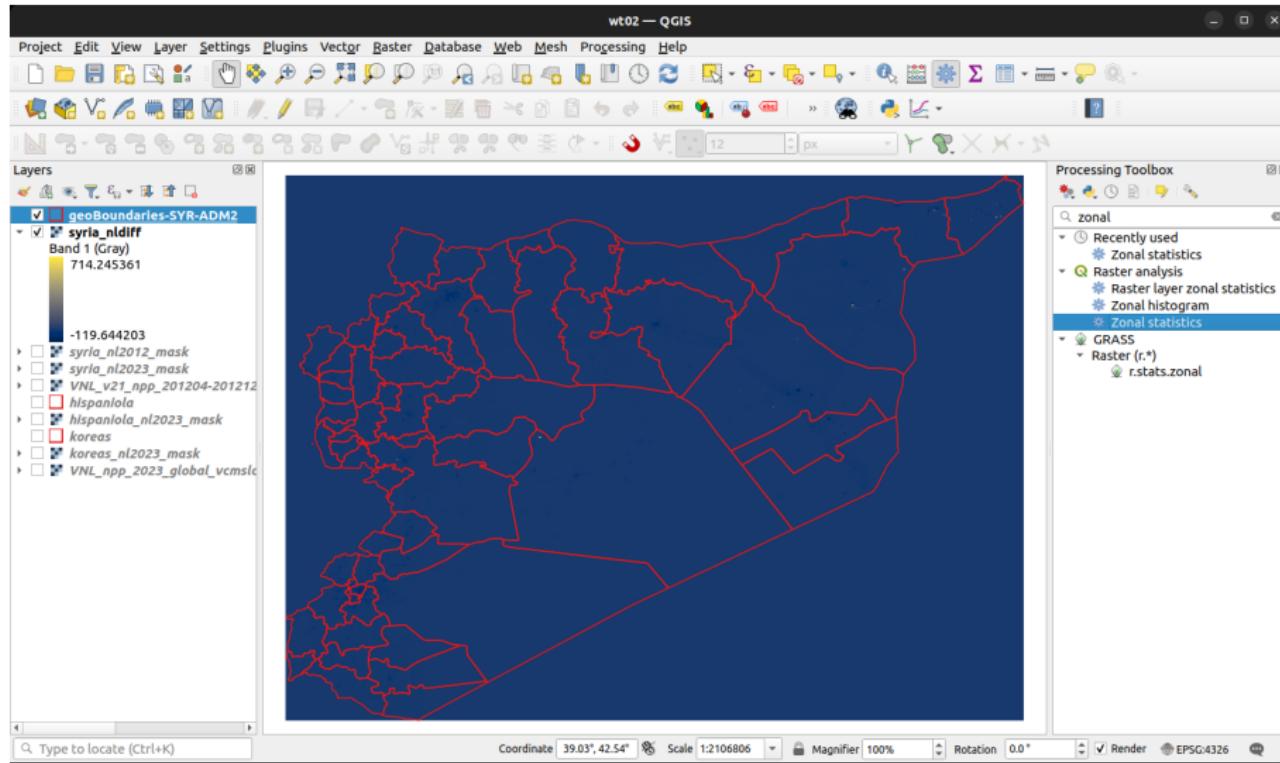

Set the expression to "syria_nl2024_mask@1" - "syria_nl2012_mask@1", save output layer as syria_nldiff.tif

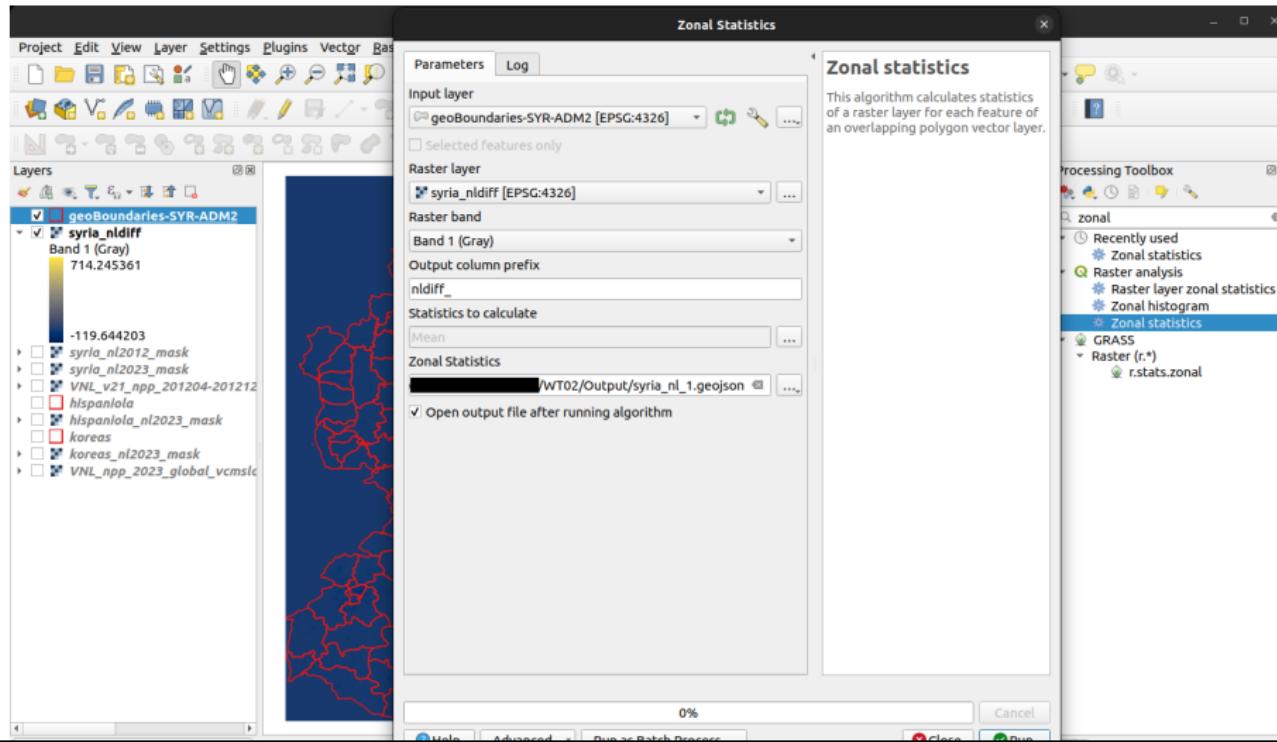

Explore the distribution of this new raster by modifying the color scheme
(here, purple areas lost luminosity, orange areas gained luminosity)

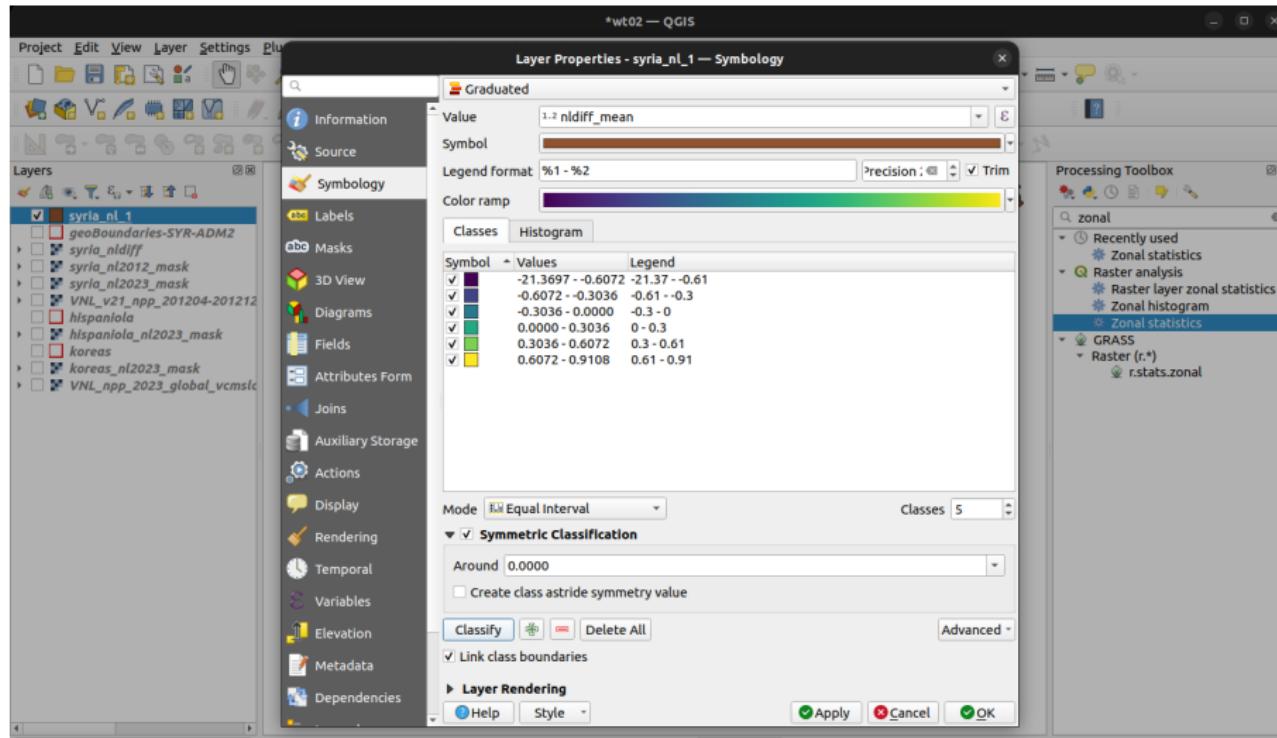

We can now calculate average differences in luminosity per district, using Zonal statistics (in the Processing Toolbox)

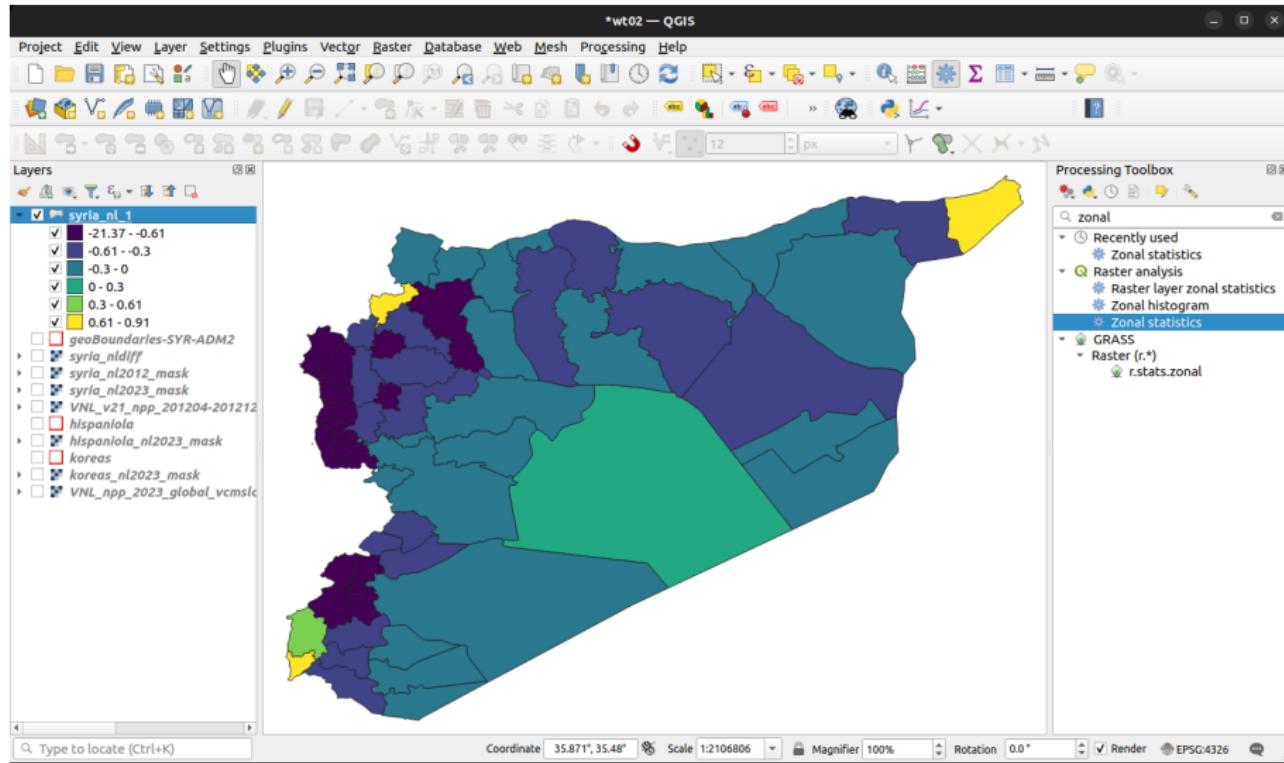

Set the Input layer = geoBoundaries-SYR-ADM2, Raster layer = syria_nldiff, Output column prefix = nldiff_. Save the output as syria_nl_1.geojson

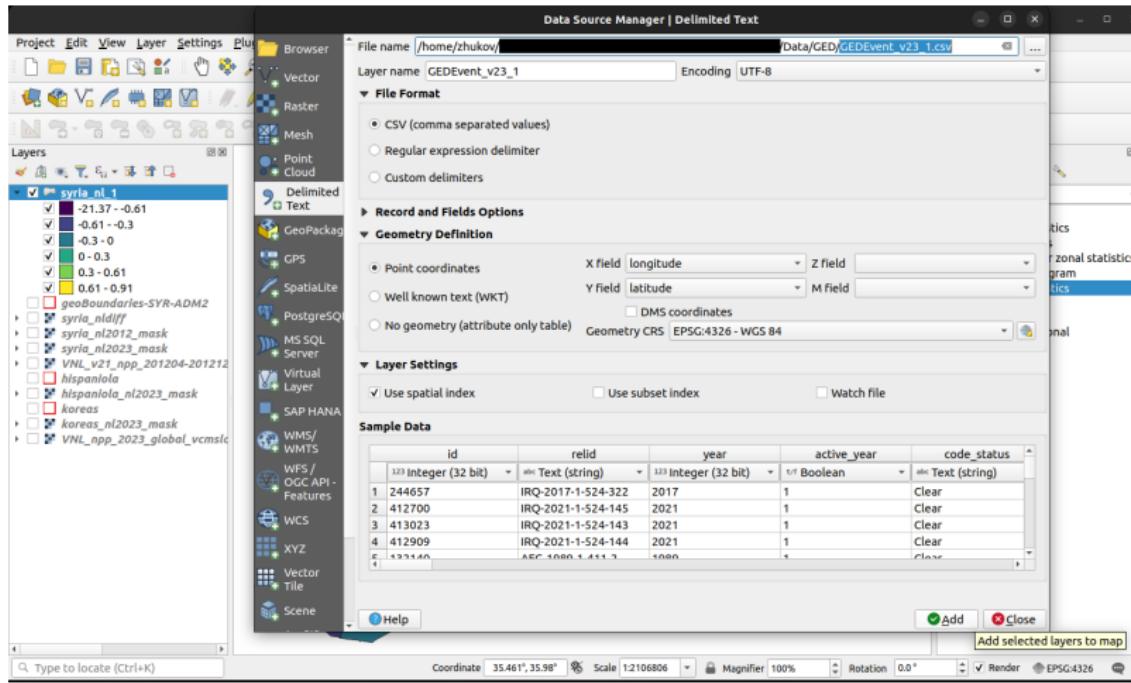

Adjust the symbology in the new `syria_nl_1` layer to visualize the `nldiff_mean` variable with graduated colors, Equal Interval mode and Symmetric Classification around 0.00

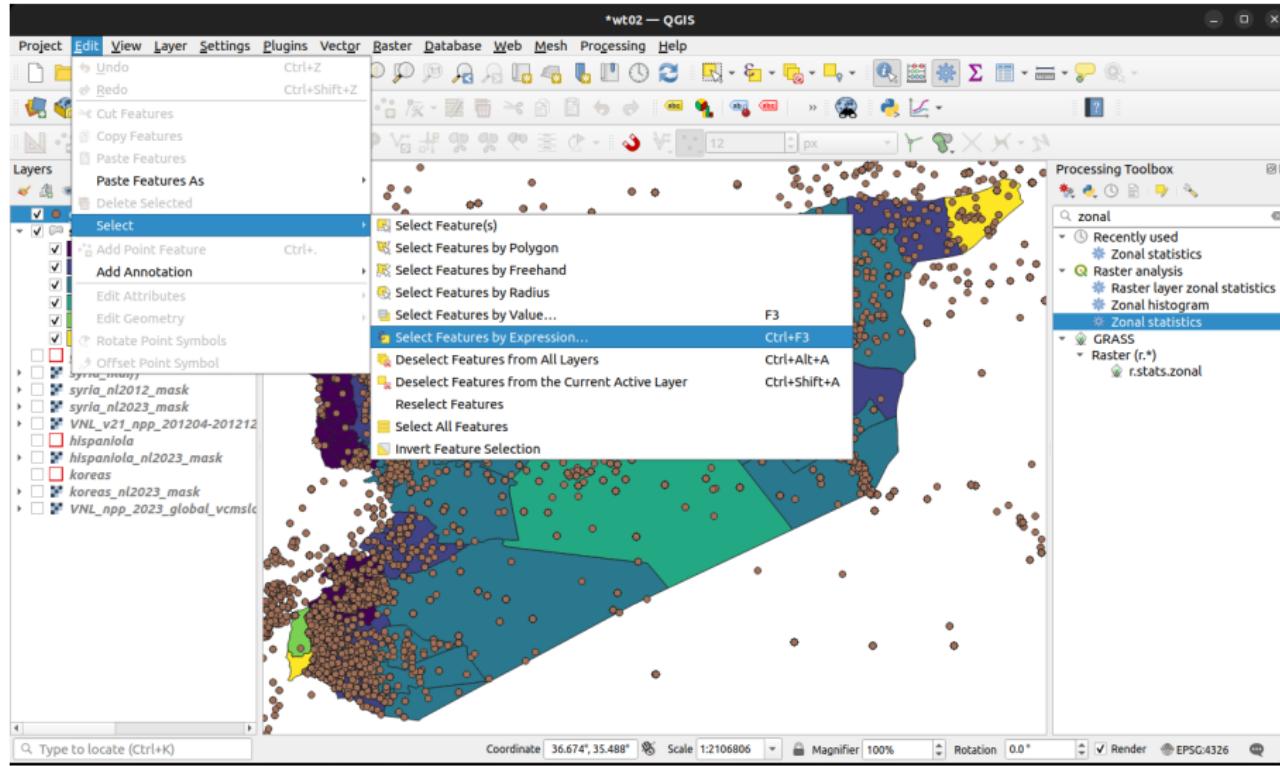

The district-level luminosity differences should look something like this.
Now let's see if places hardest-hit by violence saw the biggest declines. . .

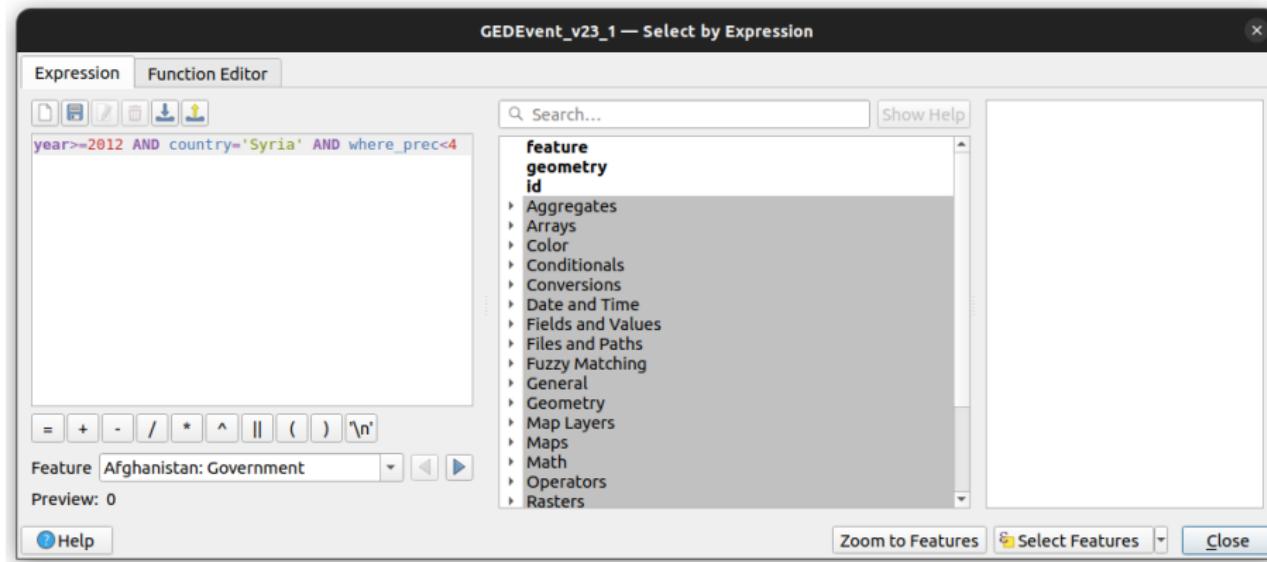

Add the *Syrian Civil War violence data* to the project, using Add Delimited Text Layer.... Load the GEDEvent_v25_1.csv file in Data/GED folder. Set X field = longitude and Y field = latitude. Check box ✓ Use spatial index

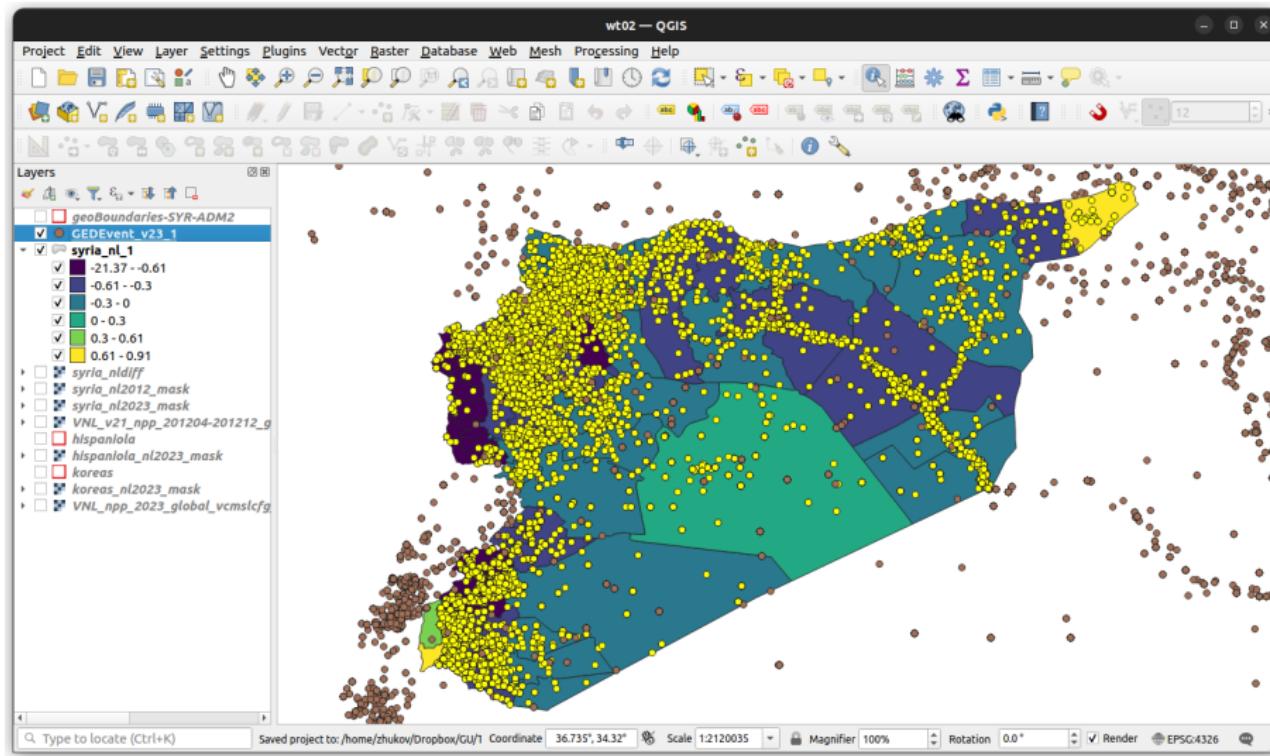

Highlight GED layer and go to Edit → Select → Select by Expression...

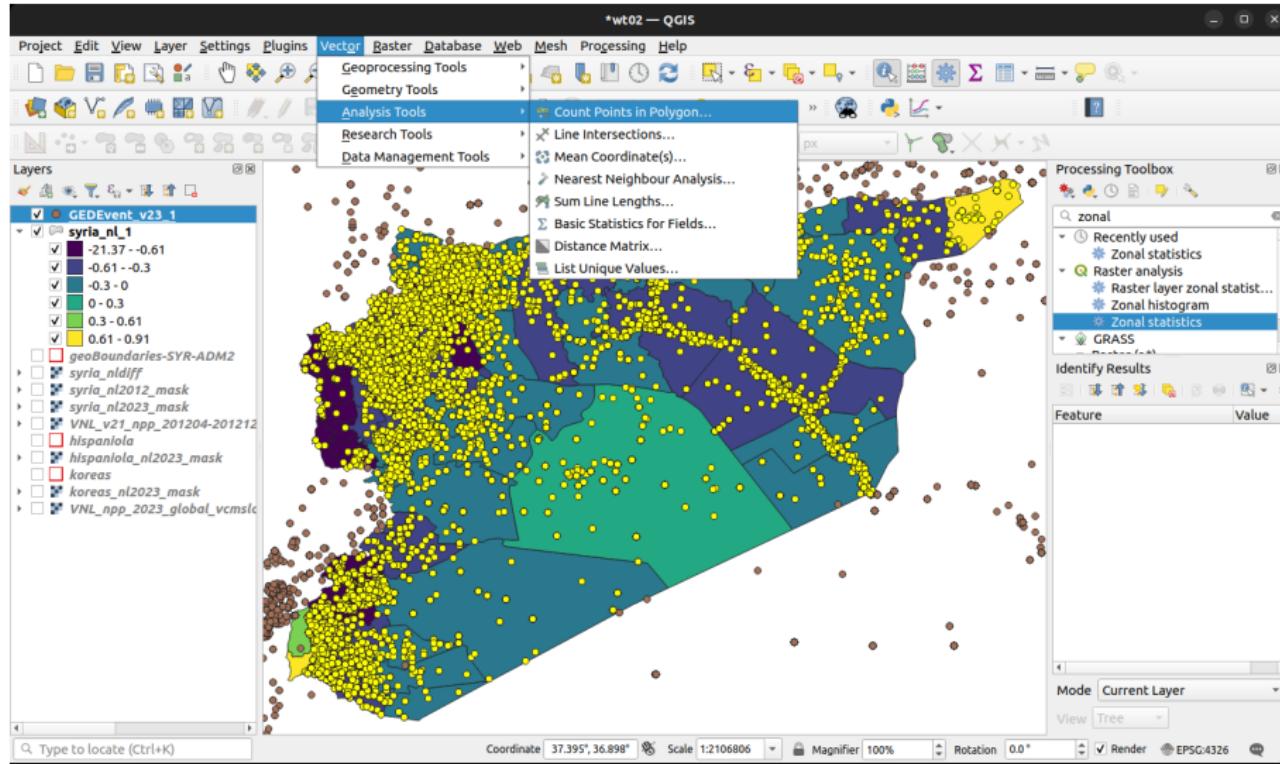

Expression: year>=2012 AND country='Syria' AND where_prec<4
Click Select Features

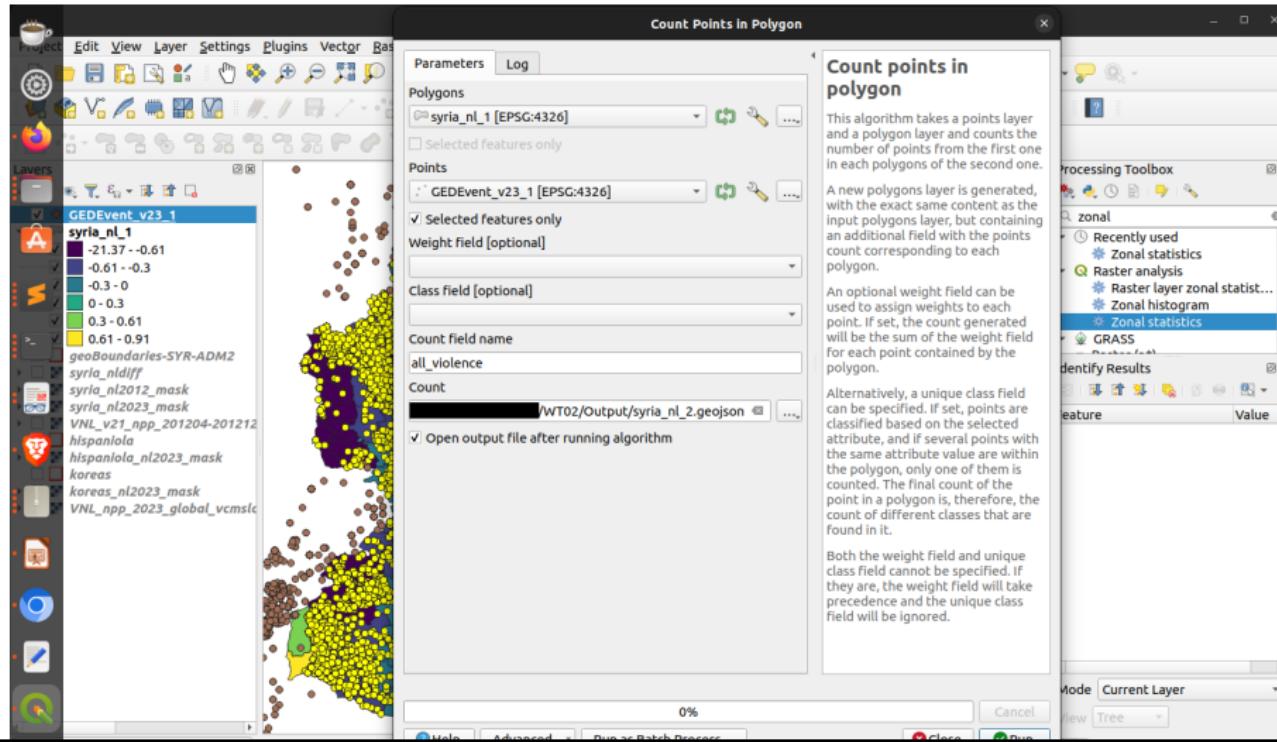

This procedure should have selected about 74.5 thousand events within Syria.
Now let's calculate the **number of violent events per district**

Open the Count Points in Polygon tool

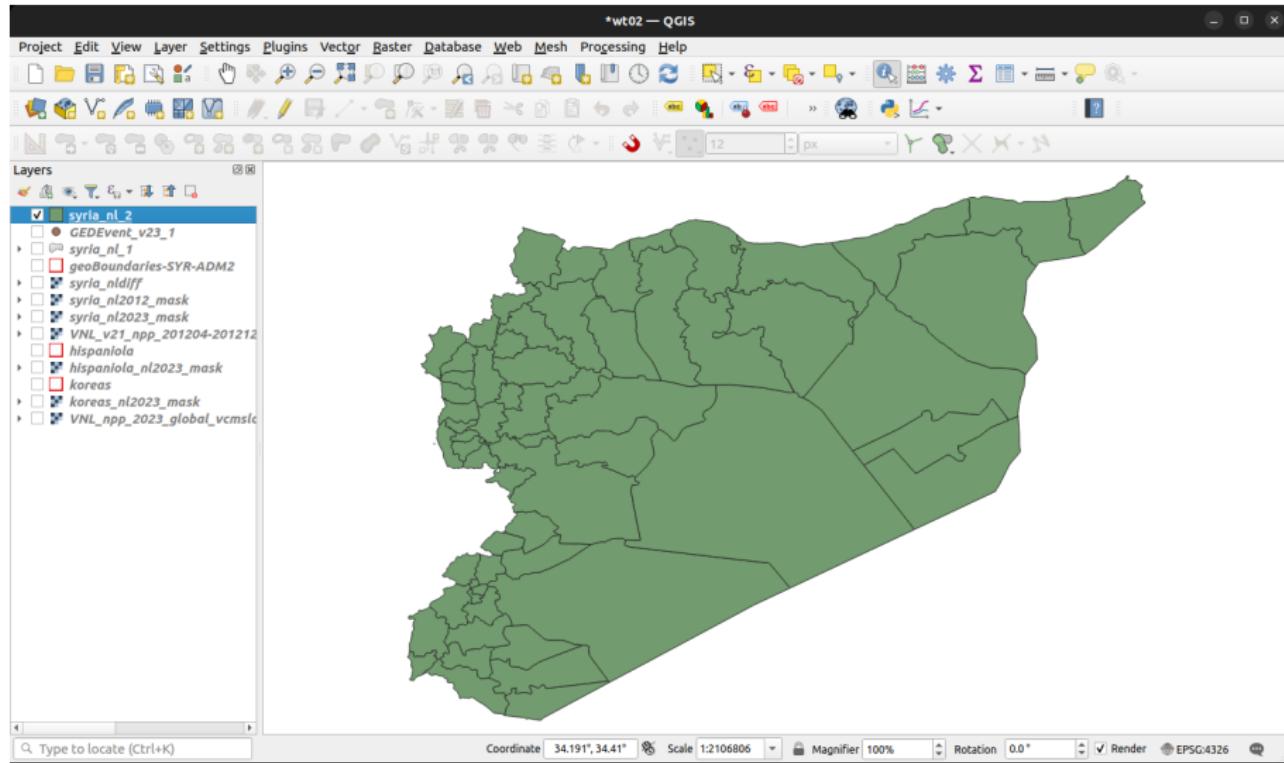

Select Polygons = `syria_nl_1`, Points = `GEDEvent_v25_1`. Make sure the box is checked next to Selected Features Only for the points. Name the count field `all_violence`, and save the output file as `syria_nl_2.geojson`. Click Run

The new layer `syria_nl_2` should appear in your project window.

Now, let's see if there is a relationship between violence and change in luminosity

Let's run a simple **regression model** in R to see how violence impacted luminosity.

This code chunk imports the `syria_nl_2.geojson` file we created into an object called `syr`, and then lists the variable names:

```
syr = sf::read_sf("Output/syria_nl_2.geojson")
names(syr)

## [1] "shapeName"      "shapeISO"       "shapeID"        "shapeGroup"     "shapeType"
## [6] "nldiff_mean"    "all_violence"   "geometry"
```

This code chunk estimates an **Ordinary Least Squares** model that regresses dependent variable nldiff_mean on explanatory variable all_violence

```
mod = lm(nldiff_mean~all_violence,data=syr)
summary(mod)

##
## Call:
## lm(formula = nldiff_mean ~ all_violence, data = syr)
##
## Residuals:
##       Min     1Q   Median     3Q    Max 
## -18.0902 -0.1057  0.3550  0.8098  2.4571 
##
## Coefficients:
##             Estimate Std. Error t value Pr(>|t|)    
## (Intercept) -0.3274582  0.4213761 -0.777   0.440    
## all_violence -0.0004381  0.0002107 -2.079   0.042 *  
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 2.61 on 59 degrees of freedom
## Multiple R-squared:  0.06824,    Adjusted R-squared:  0.05245 
## F-statistic: 4.321 on 1 and 59 DF,  p-value: 0.04199
```

Let's rescale the variable `all_violence` to make the coefficient more interpretable.

```
mod = lm(nldiff_mean ~ I(all_violence/100), data=syr)
summary(mod)
```

```
##
## Call:
## lm(formula = nldiff_mean ~ I(all_violence/100), data = syr)
##
## Residuals:
##      Min       1Q   Median       3Q      Max
## -18.0902  -0.1057   0.3550   0.8098   2.4571
##
## Coefficients:

```

For every 100 violent events, the change in luminosity falls by 0.044.

You can perform all these steps in R
(see replication code `wt02_demo.R` in `Lab10WT02.zip`)

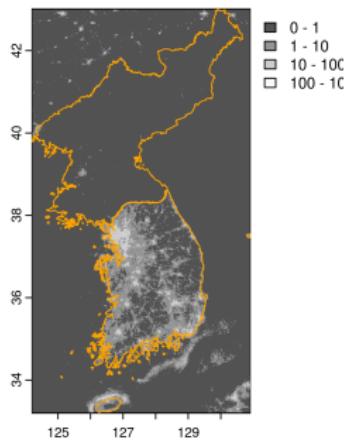

Figure 19: Vignette 1

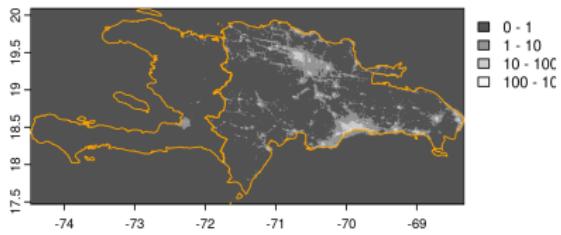

Figure 20: Vignette 2
